MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1853.

DURING the statistical year 1853 the total number of deaths reported from the funeral places was 14,164, the still-born being 242, or but 1·7 per cent. of the whole, which is nearly the ratio that has been maintained during the six years that the new registration has been in operation,—a ratio, however, that is very low compared with what has been deduced, from Returns here accessible, of European continental countries, giving an aggregate of 10,882,157 deaths, of which 4·8 per cent. were still-born. The relative smallness of the number of still-born reported in Bombay is probably in great part owing to the practice of the domiciliary interment of infants, which has been mentioned in the Reports for the preceding three years.

2. Of the 13,922 who died after birth, 7,542 were males, and 6,380 were females, the ratio being 118·2 to 100. The disproportion of the sexes shown in the Mortuary Registers at this place, has been the subject of remark since my first Report for the year 1848, and it appeared to be in a great measure accounted for by the immigration of adult males, for service and labour. The remarkable circumstance, however, of a steady large preponderance of male over female births, in all castes and tribes, which has been noted during the past four years of birth registration, has favoured the opinion, that in India the relative proportion of the sexes may be normally different from what it is in Europe. There is not yet a Census of the island of Bombay, that is in the least trustworthy, to which reference can be made for the elucidation of this or any point of vital or mortuary statistics, and it is matter of doubt if there be any Indian population

Returns that can be altogether relied on. Almost all such, however, that have yet been seen, show a large excess of males in all castes and tribes, and in both agricultural and civic populations.

3. In the course of the year it was discovered that the numerous caste of Bhatias had been erroneously included in the Boodhist group, with whom they have no religious connection, and they were transferred after the month of May, to form a group with the asareophagous Lingaets. This error has made the number of Boodhists appear unduly large in the tables for 1851 and 1852 ; but it has not affected the correctness of the division of the people into sareophagous and asareophagous. There are few Boodhists in Bombay, and, as was corroborated in this year's registers, the allied or derived Jains are in many castes Jains only by descent and family connection, while they worship Vishnoo or Sheeva. These proselytes to Brahmunism are still allowed to intermarry with those of their *Nat* or tribe who have continued unchanged in religion. A list of the Jain tribes, and of the castes of Hindoos that occurred in the registers during the year, is appended.

4. Compared with the mortality of 1852, there was an increase of 411 deaths. There were fewer deaths from *Small-pox*, but more from *Cholera* and *Measles*, while in the total of the epidemic classes there was a diminution of 129. Among the diseases not known to be epidemic there was an increase of 354 from *Fever*, of 132 from diseases of the *Respiratory System*, of 125 from those of the *Alimentary System*, 73 from *Cachexy and Debility*, and 48 from *Accident and Violence*. Under diseases of the *Nervous System* there was a decrease of 80, and under *Dropsy* of 100 deaths.

5. With reference to the mean of the preceding five years, the total mortality of 1853 was 133 in excess ; that from epidemic causes was less by 1,197, but from all other causes it was greater by 1,338, the excess being seen in all the chief classes of disease, excepting diseases of the *Nervous System* and *Dropsy*, in both of which there was a diminution of deaths. The deaths from *Small-pox* during 1853 were happily below the average of the preceding five years.

6. Making use, as before, of the somewhat uncertain standard of the deaths from ordinary causes, in the want of population Returns, the localities of the chief mortality from *Cholera* were the same as were pointed out in the Report for 1849, these being the lowest and dampest districts of the island,

rather than such as, although densely peopled, are on higher ground and without gardens. The Northern Division of the island, as usual, suffered comparatively little.

7. Girgaon is always severely visited by Cholera when the disease is prevalent, and it would doubtless be conducive to the salubrity of that part of the island if the dense plantation of cocoanut palms were removed. To clear away at once the whole of the cocoanut trees would, however, involve an expense that would not, it is thought, be readily encountered. The existence of a belt of palms, forming, as it were, a wall 70 or 80 feet high, must hinder the healthful ventilation, by the sea breeze, of the portion of the island immediately to its leeward ; but were this belt composed of only full grown palms it would be less injurious than it is now to Girgaon itself, as their shady frondage would be well elevated, and would allow the breeze to ventilate the ground beneath, with little hinderance from their slender stems. It is the undergrowth of young palm trees, filling up the interstices of the stems of those that are full grown, that acts most perniciously, and it is desirable that for the future the planting of cocoanut trees there should be prohibited ; and as these trees are rarely productive under eight years, it might be ordered that all those under four years' growth should be rooted out, some compensation being given to the owner ; and at the same time it might be notified that after four years from date given, no licenses would be granted to tap fresh trees. By these means the salubrity of Girgaon would be gradually improved, at little expense to the public, and without loss to the present cultivators.

8. The evil to ventilation caused by the custom in Girgaon, as well as in all parts of the island, of surrounding compounds and gardens with high walls, instead of open railings, should, if possible, be remedied.

9. The violent deaths were 30 above the mean of the preceding five years, and exceeded by 48 those of 1852. The drowned amounted to 51, of whom so many as 42 lost their lives in the insufficiently fenced pools, tanks, and uncovered wells. By the falling of houses, sheds, and walls, the large number of 17 were killed.

10. The written Reports of death received were one-ninth of the whole. Of the 14,164 whose deaths were registered, 7,722 were reported to have been born in Bombay, 6,397 elsewhere ; and regarding 45 no information on the point was obtained. Bombay was the country to which the families of

3,280 were stated to belong, and of 42 the country could not be ascertained. 9,680 bodies were buried, 3,672 were burnt, and 812 were exposed to be devoured by birds.

11. According to the Meteorological Abstracts supplied by the Superintendent of the Bombay Observatory, the mean Barometric pressure was 29·814 inches, the mean range was 0·116 inch, and the extreme range 0·606 inch. The mean temperature in the shade was 80·8 Fahr., or 0·7 higher than in 1852, the mean range of temperature 11·9, and the extreme range 32·4, both being less than what they were in the preceding year. The Dew Point mean temperature corresponded with the temperature of the air in its excess over that of 1852. The per-centage of Humidity in the air was 91. Rain to the amount of 69·26 inches fell, and there were 99 days on which it rained.

12. Six years of the registration of the Deaths in Bombay are now completed, and the information gathered has been duly arranged, as was proposed, in anticipation of a Census, which it was hoped would render the facts being accumulated truly valuable. At present these Mortuary Tables can be turned to only very limited use, and they are somewhat like what a Surveyor's system of triangles would be without a measured base line. It is greatly to be desired that measures may be adopted to render the approaching Census of the island correct, for it is better to be without a Return of the population than to have one so inaccurate as that of 1849. Without a legal enactment, such as is had recourse to in Britain, to render the giving the requisite information compulsory on the inhabitants, it seems almost impossible that a correct enumeration of the people can be made; for without such compulsion, with a population so large as to yield 14,000 dead a year, so diversified in race, and so little likely to give active aid in the work, although disposed to be passive, as this community is known to be, a very large establishment of enumerators would be required; and setting aside the very heavy expense of their maintenance, it would be most difficult to find a sufficient number of men available and otherwise qualified for the work.

A. H. LEITH.

Bombay, May 26th 1854.

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1854.

ON looking into the Death Returns of the past year, it is seen that the mortality has greatly exceeded the mean of the preceding six years of the registration. The total reported funerals were 18,010, or, deducting Still-born, there were 17,742 deaths from various causes, which is 3,931 above the average. The male deaths were 9,963, and the female 7,779; or in the ratio of 128 males to 100 females; the mean proportion which they bare to one another during the preceding six years being 122·87 to 100. The great fluctuations from year to year, in the ratio of male to female deaths, has led to frequent inquiries whether they could result from errors in the entries at the funeral-places; but there has not been found any reason to doubt the accuracy of the Registers on this point.

2. In this country, it is impossible to obtain from the greater part of the people any exact statement of their ages; nor was anything more than an approximation to the truth expected in individual cases. It is, however, to be supposed, that when the aggregate number of recorded ages becomes large, the errors of understatement and of overstatement will compensate the one for the other, and that thus an average not far from the truth will be obtained. The aggregate number that these Returns now afford us is, perhaps, yet too small to allow of positive conclusions being drawn; but from the 100,607 deaths at various ages that have been recorded, it is found that the mean age at death has been $24\frac{1}{4}$ years.

3. It is also found, that of the deaths that have occurred during the last
b

four years, 43·00 per cent. were below the age of 14; that 44·27 were between the ages of 14 and 54; and only 12·73 per cent. above 55 years.

4. These, and such like abstract facts, are of no present practical value, but they, as well as other information that is being accumulated in these Mortuary Tables, will become of true importance for sanitary and other civic purposes, when trustworthy Population Returns shall show the ages of the living, and their distribution in the island. It was the sanguine hope that a correct enumeration of the inhabitants would ere long be made, that led me to propose the construction of these Tables; and the expectation that these details of the dead, at present so dry and barren, would soon be elucidated, and rendered useful by corresponding Population Returns, has been an encouragement to assiduous care in their preparation.

5. The time for another Census is near, and I would with due respect state, that from the utter failure of the two former attempts at an enumeration of the people, and from much consideration of the subject, I am of opinion that it is impracticable to take a correct Census in Bombay by other means than those that are used in Britain; and there does not appear to be any valid reason why a legal enactment should not be had recourse to here, to obtain from the people that information which it is for the people's good to collect, which is necessary to allow of sanitary measures being undertaken with confidence, and which the Government of every civilized country has, or ought to possess. There is not among the Natives of this place, as those who have local experience well know, any religious objection to afford all the usual information connected with Vital or Mortuary Statistics, such as those at a distance are too apt to imagine may exist.

6. During the year under review, the deaths from epidemic causes were more numerous than in the preceding year, solely from a higher Cholera mortality, so many as 3,353 having been destroyed by that disease. There were but 313 fatal cases of Small-pox reported, which is fewer than in any of the preceding years of the registration. The number of deaths from Measles was 130, which is almost identical with that in 1853. The parts of the island chiefly infested by Cholera are seen to have been the same as in former years; but a correct knowledge of the comparative liability in different localities to the ravages of the disease can only be obtained when the population of the several localities is ascertained.

7. The deaths from diseases that may be considered of endemic origin—

as we may suppose part of the fevers, of the bowel complaints, and of the convulsions and tetanus, to be—were unusually great. It is not easy to trace the effects clearly to their causes ; but one cannot but be impressed with the idea that the loss of life is much increased by foul drains in the town, cesspools and dung-heaps, and the neglect of the drainage of the Flats from the monsoon water, since the main drain, which used to carry it off, has been banked up on each side. The burial-grounds in the neighbourhood of the town must also be a copious source of disease.

8. The disposal of the dead ought to have more attention than has yet been given to it, for, as it is now practised, there is much in it that is very objectionable ; and in considering this matter, it has to be borne in mind that the clandestine domiciliary interment of infants, which was first noticed in the Report for 1850, still remains unchecked, affording facilities for the undetected commission of infanticide, and contributing to the pollution of the air of dwelling-houses, through the decomposition of the bodies interred in or near them.

9. The state of several of the burial-grounds, both Moosulman and Hindoo, is such as to require immediate amendment, as the foul gases that taint the air in their neighbourhood are detrimental to health. The burial-ground on the north side of Grant Road may be mentioned as one of these. There is a burial-ground, however, which is so horrible and shameful, that it seems only to require to be brought to the notice of Government to have it suppressed—it is that for Hindoos at Sonapoor. The exact size of the ground is not, I think, clearly defined: the Policemen on the spot said there was an order that no grave should be dug below high-water mark ; but the tides vary in height, and there was nothing to indicate the limit towards the sea. I had the breadth of the ground measured from the outside of the outmost grave, where it was still wet from the retiring tide, to the wall of the Moosulman cemetery, and also its length north and south, as pointed out by the men on duty: the area was found to be 10,581 superficial feet. Knowing that during the last seven months 2,711 bodies had been interred there, it may be concluded that in the course of a year the number will be nearly 4,649 ; and reckoning the due proportion of these as children, it is calculated that were the year's number of bodies laid at the same time, shoulder close to shoulder, without intervening space, they would not only completely cover the whole area, but they would have to be laid in two tiers,

the second equally closely packed as the first, and there would still be more, to form part of a third tier of corpses.

10. The rapidity with which the bodies decompose is marvellous ; and yet the short time that is actually required for the process is liable to be cut still shorter at Sonapoor, for the men in charge of the place said that *eight days* was the time under which it was prohibited to re-open a grave for a new burial. He pointed out a grave just then dug, from which the remains of one who had been buried a month before were being taken up, to make room for another occupant. Were decomposition in this sandy soil not so rapid, it would of course be impossible that so many dead could be deposited there ; yet, as in putrefaction the soft solids of the body are changed into poisonous gases, the greater rapidity of the process does but the more intensely pollute the air, by giving a larger quantity of those gases in a given time. The moral effect of such a scene on those who resort to this place to deposit their dead must be bad, and on those also who become habituated to its horrors, which are sometimes even aggravated in the monsoon, by the surf washing the newly interred from their graves.

11. Along the shore of Backbay there are several other graveyards, and also a depository for dead cattle, the stench from which also is most disgusting, and overpoweringly offensive ; and all these are to the windward of the Native Town, which has its sea-breeze, that would otherwise be health-giving, thus poisoned. It is likely that the unwholesome emanations are *one* of the causes why Girgaon has what is thought to be a proportionately high mortality when Cholera is epidemic.

12. There were 8,458 deaths attributed to fever, which was 2,876 more than the mean of the preceding six years ; and it is probable that Bombay shared in the febrific influence that made the neighbouring island of Salsette so pestilential during the latter part of last year.

13. The increase in the mortality under Class V. amounted to 20.

14. Class VII., or that of *Diseases of the Respiratory System*, was the only one in which there was any considerable decrease in the number of deaths ; they were 1,466, that being 388 fewer than in the previous year, and 53 less than the mean of the foregoing six years.

15. The deaths under Class VIII. were 2,203, or 331 above the average. Under *Cachexy* and *Debility* also there was an increase.

16. Many of the casualties under Class XV. were caused by the hurri-

cane that blew on the night between November 1st and 2nd, and chiefly through the wreck of vessels in the harbour, 47 of the bodies of those drowned having been washed on shore. Four were killed on the same night by the fall of trees that were blown down, and 5 by falling houses; or, in all, 56 of the deaths were noted as caused by the storm. Death thus produced strikes with awe, and brings sudden desolation and grief to the bereaved; but it is not so revolting and horror-striking as the death of the infant that occurred in the following month, through having been partly devoured by a dog during the short absence of its mother from the shed or hut in which it lay. It is surely proper that the island should be freed from the many unowned, noisy, and, as is here seen, dangerous dogs that infest it.

17. Among the avoidable deaths were many of the 47 from drowning in unfenced pools, tanks, and wells; and to be blameless as regards the lives lost in this way, the expense of sufficient fences should not be spared. It is to be hoped that in the promised new water-supply, the drawwells and reservoirs will be of a less dangerous construction than the present are.

18. The Still-born were 268, or but 1·48 of the whole 18,010 that were brought to the funeral-places.

19. There were 12,516 buried, 4,611 burnt, and 883 exposed to the vultures. Bombay was stated to have been the birth-place of 8,550, while 9,349 were said to have been born elsewhere, and of 111 the place of birth was unknown. Bombay was given as the country to which 3,963 belonged, and of the rest 13,963 were of other countries, and of 104 information on this point was not obtained. The written Reports of Death were somewhat more numerous than in former years, amounting to one-eighth of the whole.

20. In reviewing the Meteorological Summary of the year, the facts that seem most influential were the cyclone of 1st and 2nd November, when the maximum force of the wind registered was 35 lbs. on the square foot, and the unusually great quantity of rain so late in the season as October and November: the total fall in the year was 82·13 inches. The variations in the hygrometric results received from the Observatory are not easily accounted for. Since 1848, the mean per-centage of humidity in the air has fallen progressively from ·94 to ·86, having seemingly been uninfluenced by the quantity of rain, the number of days on which rain fell, or the number of hours during which the land-wind or sea-breeze blew; and

while the mean humidity is shown to have fallen from $\cdot 91$ in 1853 to $\cdot 86$ in 1854, the mean dew-point has risen from $71\cdot 5$ in 1853 to $72\cdot 4$ in 1854, the mean temperature of the air having decreased one-fifth of a degree. The mean temperature of the air in the shade was $80\cdot 6$, the mean daily range $11\cdot 34$, and the range of the year $38\cdot 4$. The mean atmospheric pressure was $29\cdot 205$ inches, the mean daily range $\cdot 115$; and, owing perhaps to the storm in November, the annual range was so great as $\cdot 928$ inch.

A. H. LEITH.

Bombay, May 28th, 1855.

NUMERICAL TABLES.

I.

CLASSIFICATION OF CAUSES OF DEATH.

- I. Cholera.
- II. Small-pox.
- III. Measles.
- IV. Fever.
- V. Disease of the Nervous System.
- VI. „ „ Vascular System.
- VII. „ „ Respiratory System.
- VIII. „ „ Alimentary System.
- IX. „ „ Urinary System.
- X. „ „ Sexual System and Child-bearing.
- XI. „ „ Locomotive and Tegumentary Systems.
- XII. Cachexy and Debility.
- XIII. Leprosy, Tubercular and Articular.
- XIV. Dropsy.
- XV. Accident and Violence.
- XVI. Other and Unknown Cause.

EIGHTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1855.

THE Registration of last year was carried on with the usual steady regularity that has been observed since its commencement, and there was a little improvement in the proportion that the written bore to the oral reports received at the funeral-places, those being one-eighth of the whole. The most unsatisfactory part of the Returns is that showing the Causes of Death. It was hoped, perhaps too sanguinely, that the better educated of the people would take interest in the object in view, and would give their aid to make the registration useful to medical science ; but the hope has been disappointed. Even the Grant Medical College Graduates in practice in Bombay have, as if with one accord, withheld the aid that was confidently expected from them, and during the year scarcely one report of death was received from them, except what was obtained on the special requisition of the Superintendent of Police. It is known that in their practice there are difficulties in the way of reporting fatal cases, from the hurried funeral that takes place, and from the friends of the dying patient frequently changing the medical attendant ; but notwithstanding these impediments, it is in their power to give valuable aid to the registration, and this has been pointed out to them ; but, apparently through apathy, they will not take the little trouble that it would involve to forward medical science in this point.

2. It is not medical men only who can help in the registration : much may be done by all who, from their rank or education, are influential in their

respective classes of the people ; for many now in sickness employ the aids of European medical science, and have it in their power to obtain from a skilled medical attendant the exact name of the disease causing death. Among other ways of improving the registration, it may be suggested that the Parsees, who preferred to collect by their own servants the Death Reports for the Police, should place at their cemetery a man who would take the trouble to obtain from the funeral parties correct information as to the cause of death, either through written or oral reports. This they engaged to do ; but there is too great reason to think that the work might be more efficiently performed than it now is.

3. The causes of death among Europeans are almost invariably reported in writing, and as that portion of the Returns may be considered on that account more accurate and more complete than what is obtained by oral report, it may be useful to exhibit it in a separate form, as in Table I^A, as well as in the general Table I.

4. The deaths registered were 14,928, which is 3,082 less than in the preceding year, and 295 above the average of the preceding seven years. The reported still-births were 281, or in the ratio of 1·88 to the whole.

5. Of the 14,647 deaths that occurred after birth, 8,064 were males,* and 6,583 females, or in the ratio of 122·5 males to 100 females, the mean proportion for the previous years being about 124. There was a slight preponderance of female deaths among the Parsees and among the Jews, but the latter race is here so few in number, that great fluctuations are to be expected in it : the male deaths were in excess in every other ethnological class of the population.

6. The ages recorded are only approximative, and in the present state of the community they cannot be exactly known. From the registry of the year, the mean age at death was $23\frac{3}{4}$ years ; but, in stating this result, it must be repeated that there is a great influx of adults, and a tendency, also, to exaggerate the ages of the old.

7. A Table arranged according to Occupations has been given annually ; but as there are in it so many headings among which the mortality has to be distributed, the number under each of these in any one year is small. From the wife and children often helping, but to a varying and uncertain extent, in

the trade of the head of the family, it is difficult to state correctly how many persons are actually engaged in the different occupations, and it is thought more useful, for statistical purposes, to note the numbers that derive their subsistence from each branch of industry, than to restrict the table solely to an attempt, which would at present be most unpromising, to show how occupation influences disease.

8. The subdivisions of the Hindoo castes and Jain *Nat* that occurred in the Registers, have again been tabulated, but the male and female deaths are now shown separately. The Moosulman races also are specified, so far as they were ascertained. Both this Table and that of Occupations will be chiefly useful in the elucidation of future Population Returns.

9. Of the 14,647 deaths, exclusive of Still-born, that were registered, 2,753 were from epidemic causes, which number is in the ratio 18·8 per cent. and falls short of the annual mean by 458. The Cholera deaths were 1,739, or 677 less than the average of the preceding seven years. The months in which they chiefly occurred were April, May, June, and July. The Sarcophagous tribes suffered more than the Asarcophagous, and of the former the Hindoos more than the others. But locality of residence seems to have a more uniform influence on this disease than other observed circumstances; and taking, as in former years, in the absence of Population Returns, the deaths from all causes except epidemics, for comparison, the Cholera deaths were in excess of the due proportion in Mazagaon, Oomburkharee, Colaba, Dhobee-tulao, Girgaon, Chaoputee, Walkeshwur, and Mahaluxmee; the sections with houses closely built in dry streets, although densely peopled, being, as usual, proportionally freer from the disease than where there is much water, or there are irrigated gardens. Division F, occupying the northern end of the island, again affords an exception to this. There were 1,014 Small-pox deaths reported, that being 701 more than in the preceding year, and 300 more than the yearly mean hitherto registered. The mortality in each of the eight years through which the record has been kept has, with one trivial exception, had its minimum in October, and its maximum in April. There was no death from Measles registered.

10. The deaths registered as from Fever were 6,685, a number greater than half of that from all causes except Cholera and Small-pox, and forming $46\frac{1}{2}$ per cent. of the total mortality. There is little room to doubt that the

entries in the Register under this head are more numerous than they would be, were the diagnosis between Idiopathic and Symptomatic Fever correctly made, or even were the friends to report more faithfully the observed cause of death. That the mortality from Endemic Fever is in reality great is undoubted, and it is of grave importance that the causes of the disease should, if possible, be removed or lessened.

11. Science has not yet decided what are the causes of Remittent or Intermittent Fevers, such as produce so great mortality in this place,—whether they are altogether telluric, or only partly so and partly atmospheric : that a certain condition of the surface of the ground and periodic fever are connected, as cause and effect, is generally admitted ; and such a condition seems present in the salt marshes that lie between Trombay and the north end of Bombay, and along the south and south-eastern shores of Salsette, where they have a surface of probably not less than thirty square miles, and which also fringe the western side of the last named island. It is possible, also, that the powerful febrific influences present in the uncultivated valleys of Salsette may extend in some degree to Bombay.

12. Another probable source of febrile disease is present in the Flats, that were at one time salt marsh, over which the sea at high tide flowed, insulating the higher portions of this island from one another, until it was excluded by the embankments or *vallades* at Dharavee, Wurlee, and Mahaluxmee. Much of the recovered land has been brought under cultivation, and most of it must have become greatly purified by the annual rains ; but the soil, even in these portions, is not yet totally freed from organic matter, and as, from neglected drainage, a large surface continues moist until long after the end of the south-west monsoon, it is still likely to give out unwholesome exhalations.

13. There is a portion of the Flats lying between the drain and the Mahaluxmee Vallade, measuring about 189 acres, which is kept in the state of salt marsh by the sea-water passing through the foundations of the vallade. This last evil might be remedied by the engineer's skill ; and the noxious influences of the Salsette marshes would gradually lessen were these brought under cultivation.

14. The deaths from Disease of the Nervous System were 572, a number somewhat greater than in the preceding year. From Disease of the Respiratory System there was a recorded mortality of 1,265, which is 211 less than

in the year 1854 ; but in both years the ratio of this to the mortality in the other classes of disease is the same. Under Class VIII. or Disease of the Alimentary System, there were 1,925 entries, or 278 less than in the former year.

15. Diseases of the Vascular and Urinary Systems, not being always easily recognised by the unskilled, probably, in reality, occurred oftener than is shown in these Returns. From the former there were recorded last year but 14 deaths, and from the latter but 10.

16. There was a considerable diminution of casualties under Class X. but an increase under Diseases of the Locomotive and Tegumentary Systems, and also under the too vague term Debility. From Leprosy there were 40 deaths, and 79 from Dropsy, and there were 14 from unknown and unspecified causes.

17. The deaths from Accident and Violence were 151, which is 47 fewer than in the preceding year. Drowning, as usual, was the cause of much of the mortality in this Class. The funerals of 52 drowned were recorded : of these 13 perished in the sea, and 39 in fresh waters ; and of the latter 23 were reported as having been drowned by accident. Of the total drownings 5 were homicidal, and 16 suicidal.

18. Of the 14,928 registered, 10,282 bodies were buried, 3,862 burnt, and 784 exposed. The place of birth of 7,235 was said to have been Bombay, that of 7,639 elsewhere, and of 54 to be unknown. The country to which the family belonged was in 3,103 instances stated to be Bombay, in 11,772 to be elsewhere, and in 53 to be unknown.

19. From the Meteorological Observations supplied from the Observatory, the mean Barometrie Pressure was 29·832 inches, its mean range ·116, and its extreme range ·974 : these results closely correspond with those of the preceding year. The mean Temperature of the air was 80°9, which is 0°9 greater than the average of the preceding seven years ; the mean range was 11°4 ; and the absolute range of the year but 29°6. The Hygrometric states of the air, as furnished from the Observatory, give results that it is difficult to understand* : the Humidity of the year has progressively fallen from 94 per cent.

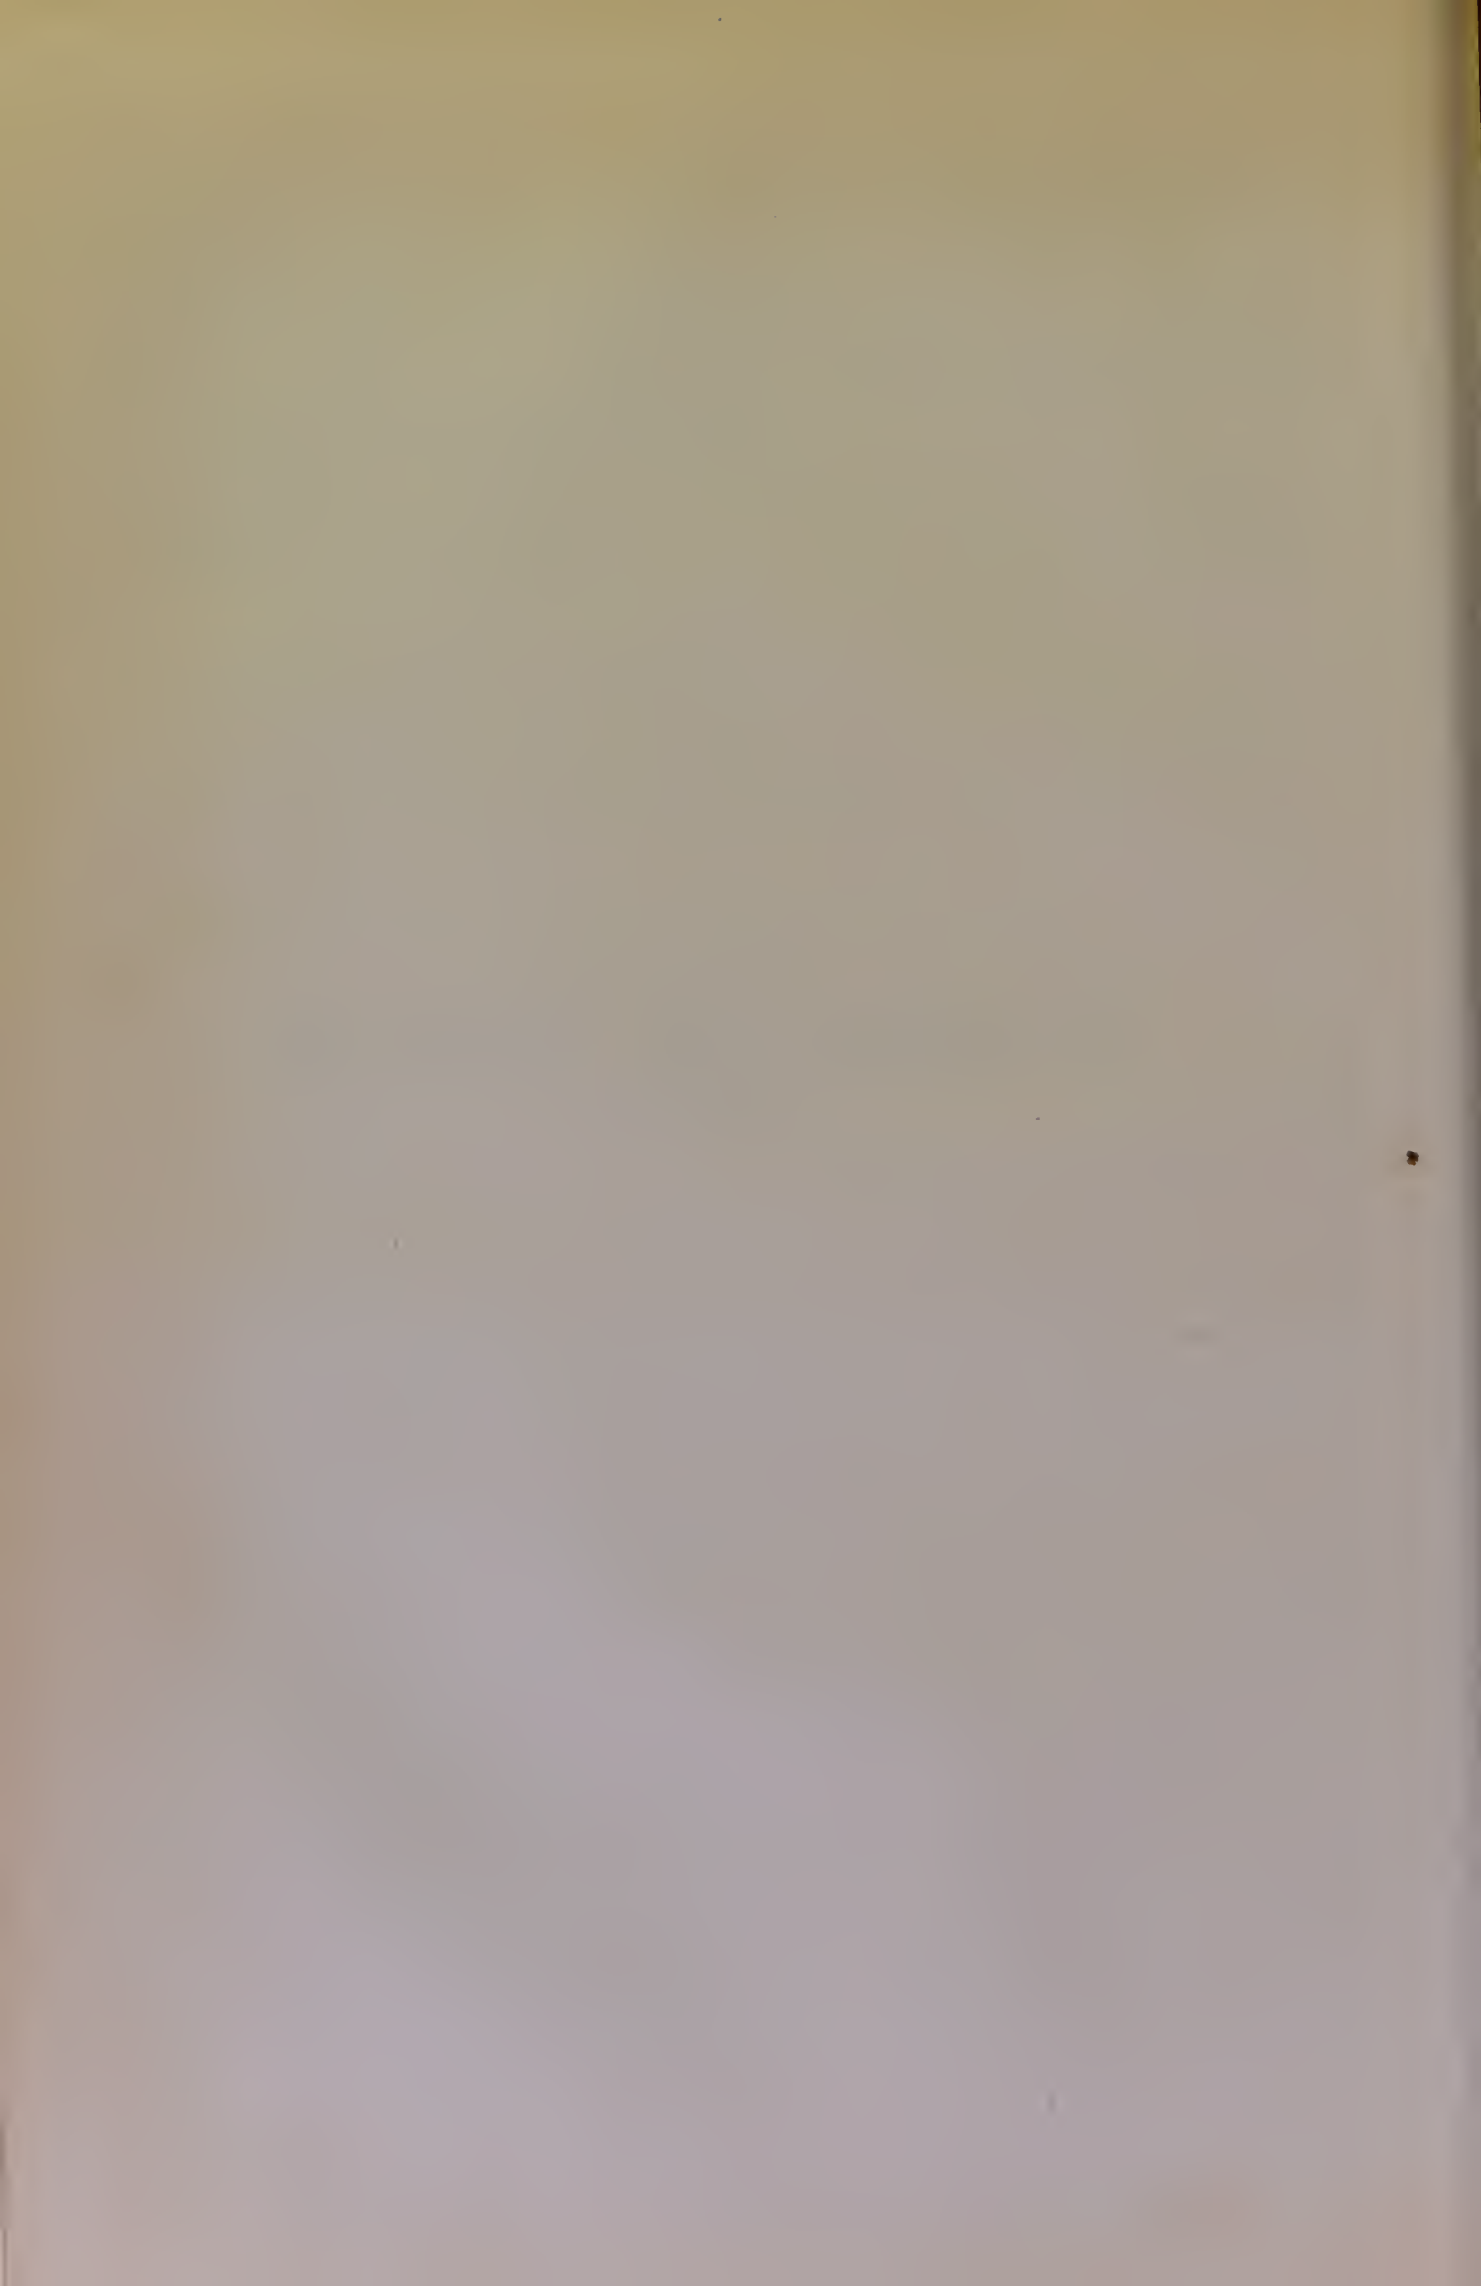

* On inquiry, it is learnt that the anomalous changes in the recorded humidity of the air are attributable to a change in the formula by which it is calculated ; Professor Orlebar's being laid aside, and Mr. Glaisher's adopted.—A. H. L. ●-

in 1848 to 77 per cent. in 1855, and while the per-centage of Humidity has decreased from ·91 in 1853 to ·77 in last year, the Dew-point has risen from 70°9 to 72°1, and not in exact conformity with increase in the Temperature of the air. The Sea-breeze prevailed as usual during 19 hours, and the Land-wind during 5 hours of the twenty-four. The fall of Rain was only 41·18 inches, but it was distributed over 91 days.

Bombay, 30th June 1856.

No. 2324 OF 1856.

GENERAL DEPARTMENT.

To the MEDICAL BOARD.

Letter from the Acting Secretary to the Medical Board, No. 1809, dated 5th July 1856, submitting Mortuary Report for the Year 1855, and making certain observations and recommendations with reference thereto.

Resolution of Government on the above, dated 17th July 1856.

The Medical Board should be requested to convey to Dr. Leith the best acknowledgments of Government for his valuable Mortuary Return for the past year, which, it is gratifying to observe, proved less unhealthy than the preceding one.

2. The fact of Medical Practitioners having evinced apathy in aiding Dr. Leith in his laudable endeavours to promote the very important branch of statistical knowledge adverted to in the 4th paragraph of the Medical Board's letter is much to be regretted ; but Government hope that a better state of things will arise, when their sentiments on this subject shall have been made known, which should be done in the manner suggested by the Board, namely by a Public Notice in the *Government Gazette*. The Medical Board should be requested to prepare and submit the draft of a suitable Notification on the subject.

3. The course proposed by them in the concluding paragraph of their letter is approved.

4. The Governor in Council also resolves that a representation, on the subject of the latter part of paragraph 2 of Dr. Leith's Report, should be made to the Parsee Punchayet, through their President, Sir Jamsetjee Jeejeebhoy.

5. The subject of the first part of paragraph 13 of Dr. Leith's Report will be referred for the early consideration of the Board of Conservancy.

6. The Mortuary Report, with its Appendices and the above Resolution, should be printed on account of Government.

(True copy)

(Signed) W. HART,
Secretary to Government.

NINTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1856.

THE Registration received more aid in the way of written reports than it had ever before got, these being one-seventh of the whole number; the increase being mostly towards the end of the year, and after the Government Circular (Appendix) was sent to Medical Practitioners and a letter was addressed to the Parsee Punchayet. The great assistance given by several of the Grant College Graduates in response to the Circular, is now duly acknowledged. If the effort of the Graduates thus evoked be vigorously sustained by them, and be joined in by the others in Medical practice, the value of these Tables will be greatly enhanced in future years.

2. The reported deaths during the year 1856 were 15,783, or 855 more than those of 1855, and 1,105 above the mean of the preceding eight years. Of these 288 were Still-born, which is 17 above the mean of former years, and 7 above last year's reported Still-born.

3. There were 2,151 deaths from Cholera, that being 412 more than in 1855, but below the average of former years. As had all along been observed, there was a preponderance of mortality from this cause in the districts lying along the sea-shore, and a very decided degree of freedom from it in the sections densely occupied by houses and without gardens. In former Reports, it was pointed out that Mahim appeared to be an exception to what was thought to be the rule, but on further investigation its immunity is found to be only apparent. In the absence of Population Tables, recourse was had to

a standard of comparison afforded by the mortality from all, excepting Epidemic causes; the effect of other causes being presumed to be nearly equally felt over all the Island. It is now, however, so manifest in the Returns that Fever deaths are reported in unequal ratios in different localities, that the mortality from Fever also is now excluded, and a standard is made consisting of the proportions of deaths in different localities from all causes, exclusive of Cholera, Small-pox, Measles, and Fever.

4. From the aggregate of the last nine years, it is found that Cholera is in excess in the following districts: *Dhobee-tulao*, *Girgaon*, *Mazagaon*, *Harbour*, *Chaoputee*, *Oomburkharee*, *Esplanade*, *Mahim*, *Wurlee*, *Seo*, and *Mahaluxmee*; with an intensity greatest in the first of these, and diminishing in the order given. It is below the standard in the following districts, the immunity from it being in diminishing series: *Fort*, *Mandwee*, *Khara-tulao*, *Bhooleshwur*, *Kamateepoora*, *Colaba*. When *Girgaon* and *Chaoputee* cease to be cocoanut plantations, there is reason to expect that their obnoxiousness to Cholera will be lessened, and that the expectation of life among their inhabitants will be increased. As the mortality from Cholera seems to depend so much on the moisture or dryness of the soil, it is a matter of grave importance that the efficiency of the drainage of the Island shall at least keep pace with the increased influx of water which will come from the Vehar works.

5. From *Small-pox*, the next of the usual Epidemic diseases, there was a lower mortality than had been registered in any of the preceding eight years; it amounted to only 200.

6. *Measles*, from which no death had been recorded in 1855, had 1 death attributed to it in August, 2 in October, 8 in November, 31 in December, and 122 in January; the year thus closing while the Epidemic was rapidly advancing. The mortality, as was to be expected, was chiefly among children. The deaths from all these three Epidemic causes were 2,515.

7. The registered deaths from other causes amounted to 12,980, being 1,086 in excess of the preceding year, but below the number in the year 1854. *Fever*, as usual, was the disease to which the larger portion of those deaths was ascribed. On examining the distribution of the Fever deaths during the past nine years, there is found reason to suppose that there are two causes to which its origin or its deadliness may be assigned; one is the vicinity of

Salsette with its extensive salt marshes, and the other is impure air, vitiated by a dense population, having imperfect means of disposing of the night-soil, and deficient scavenging.

8. The first of these causes appears to be most active in the northern end of the Island, or that part of it which is nearest to Salsette and most directly to the leeward of the marshes when the night land-wind blows. Thus while for the whole of Bombay the Fever deaths are to the other deaths, exclusive of the Epidemic, in the ratio of 544 per mille, they are in the F Division, which forms the northern end of the Island, in the ratio of 706 ; and in the A Division, which is the farthest south, and therefore most distant from Salsette, the ratio is but 481 per mille : in D and E, the more rural of the intermediate Divisions, the ratios are 524 and 514 respectively. Or if the separate districts of these Divisions be taken, it is found that in F, the district of *Seo*, which is nearest to the Salsette marshes, and most exposed to such morbid influences as may be wafted by the land-wind, the ratio is 763 ; in *Mahim*, the next in proximity, it is 691 ; and in *Wurlee*, the third in distance and order of exposure to the land-wind passing over Salsette, it is 651. In the *Parell* district of E, lying immediately to the south of the *Seo* and *Mahim* districts, the ratio is 564, while in the *Mahaluxmee* and *Walkeshwur* districts of D, it is 522 and 532 respectively. In A, the *Esplanade* has a ratio of Fever deaths of 517, the *Fort* 488, and *Colaba*, the extreme southern district, has the ratio of 424.

9. The reason for supposing that the evils attending dense population, with deficient cleanliness and ventilation, foster or aggravate Fever, is that in the most thickly peopled districts the ratio of Fever deaths is higher than in the surrounding districts less densely inhabited : thus *Mandwee* has the ratio 617, *Oomburkharee* 567, *Bhooleshwur* 551, *Market* 544, while the *Esplanade*, *Dhobee-tulao*, *Girgaon*, *Kamateepoora*, and *Mazagaon*, which nearly surround them, have ratios of Fever mortality varying from 498 to 528 per mille. The high mortality of 567 in *Tarwaree* is not yet accounted for ; the aggregate of deaths in that section is comparatively small, and it may be that when a larger amount of observations is accumulated, the ratio may be modified.

10. Such is the result of the observations of the past nine years. In estimating its value, it is to be borne in mind that the Causes of Death are

very far from being stated with perfect correctness, and that the absolute number of Fever deaths may be erroneously given ; but it has, at the same time, to be considered, that it is probable that the same error pervades the reports of all the sections alike, and that the ratios are likely to approximate more nearly to the truth than do the sums. Again it is to be remembered that the observations from which the direction of the night-wind is deduced, were made at the extreme southern end of Colaba, a position possessing many advantages for the prosecution of the main objects of the Observatory, but from its distance of more than 11 miles from the part contiguous to Salsette, these observations may not afford a strictly true indication of what the winds, especially when light, are in a part so differently situated as to surrounding land and water. Observations on the azimuth of the wind ought to be taken at various parts of the Island, and, as a first step towards this, a wind-gauge might at once be placed at the Signal-station on Parell Hill, which seems a desirable position for the purpose.

11. There were unusually few deaths referred to disease of the Brain and Nervous System, the total being but 478, or 94 less than in the preceding year, or 92 less than the mean of former years. The deaths, however, from Apoplexy and Paralysis were increased : in those from Tetanus there was a diminution to the extent of 123.

12. In Class VI. there were 23 casualties, of which 7 were from Aneurism. The deaths from disease of the *Respiratory System* were 1,177, which is 76 per mille of the total mortality of the year, or 90 per mille if the usual Epidemic causes are excluded : both the aggregate number and the ratio are less than in 1856. There were 2,139 deaths registered under disease of the *Alimentary System*, which number is 214 in excess of that of last year, and about the same in excess of previous years. In Class IX. there were 10, the same small number as in 1856. In Class X. there were 147 reported deaths, nearly all of which occurred in Child-bed.

13. Of the 110 deaths in Class XI. there were 24 attributed to Guinea-worm, and if the 5 cases in which it is stated to have been the cause of Traumatic Tetanus be added, the total deaths in the year from this parasite of the integuments amounted to 29.

14. The deaths entered in Class XII. amounted to 1,113, a number much in excess of that of last year, and 491 greater than the average of

former years. The increase is under the head *Debility*, and can best be accounted for by supposing that those employed to receive the Death Reports carelessly omitted to ascertain what was the cause of the debility. The reported deaths from *Leprosy* were 32, the mean number having before been 45; and the number from *Dropsy* 162, which also was below the average.

15. From violent deaths 143 were reported to have perished, of whom 48 were drowned; 14 in the sea and 34 in fresh waters. In the 27 instances in Class XVI. the causes of death were not specified.

16. The distribution of the deaths among the various races and sections of the Community was nearly in the following millesimal proportions:—Brahmuns, 23 per mille; Lingaets and Bhatias, 18; Hindoos of other caste, 510; Out-caste Hindoos 60; or adding together all of Brahmunicipal religion, the amount was 611 in a thousand. The Boodhists, chiefly Jains, were 38 in a thousand. The Moosulmans, including the Negro-Africans, as they are mostly of that religion, 245. The Parsees were 47 per mille; the Jews, 4; Native-Christians, 34; Indo-Europeans, 4; Europeans, 14; or adding all classes of Christians together, these were 52 in a thousand.

17. As many come to Bombay unaccompanied by their families, the above numbers do not show the true proportions that the deaths among those who may be in the vigour of years bear to each other. Taking therefore from the Tables the numbers of males above 14 and under 55 years of age, it is found that of the Boodhists there were 42 in a thousand; of the Hindoos of all kinds, 609; Moosulmans, 240; Parsees, 23; Native-Christians, 46; Indo-Europeans, 4; Europeans, 30; or of all Christians together, 80.

18. The proportion of male to female deaths is subject to very considerable yearly variation, although the male always greatly exceed the female, and during the nine years in which the deaths have been noted, the proportion has ranged from 115 to 132 of the males to every 100 of the females: in 1856 it was $126\frac{3}{4}$. In eight of these years the ratio of disparity between males and females in the returns has risen or fallen with the increase or diminution in the aggregate of deaths, and on referring to the different periods of life in the Tables, this correspondence has been observed only at ages above 20 and under 55, or the ages at which male temporary sojourners on the Island are likely to be most numerous. These observations tend to the conclusion that the higher mortality of some years, and the lower of others,

is partly to be attributed to there being more adult male lives at risk in the former than in the latter. The year 1849 was the only year in which this accordance of the ratio with the aggregate of deaths was not observed.

19. Of the dead, 7,143 were said to have been born in Bombay, 8,559 elsewhere, and of 81 the birth-place was unknown. The families of only 2,877 were said to belong to Bombay, and in 73 instances no information on this point was obtained. There were buried 9,953; there were 5,082 burnt, and 748 were exposed in the Parsee cemeteries.

20. From the Meteorological Observations it is found that the mean temperature of the year was $80^{\circ}3$, which is merely $\frac{1}{5}$ of a degree above the average of the preceding eight years; the mean daily range of thermometer was $10^{\circ}6$, or 1 degree less than the average of former years; and the mean humidity of the air was $\cdot 78$, or 1 per cent. more than in 1855. The rain gauged at the Observatory was 65·93 inches, while the average of the preceding eight years was 61·24 inches. It is likely that less rain falls at the Observatory than at any other part of the Island; it has been found that considerably more falls in the Fort, and still more at Byculla, than at Colaba.

A. H. LEITH, M.D.

Bombay, 22nd July 1857.

APPENDIX.

GENERAL DEPARTMENT.

With a view to ensure correct Registration of Deaths in the Island of Bombay and Colaba, the Right Honorable the Governor in Council requests that all Medical Practitioners, European and Native, will furnish a Death Report, according to the annexed Form, in every fatal case occurring under their respective care or observation, to the Friends of the deceased, to be delivered by them, or by the Funeral Party, or by the Undertaker, at the time of the Funeral, to the Policeman at the place of burial.

It is unnecessary to point out to those who have received a liberal medical education, the usefulness of correct Mortuary Returns for sanitary purposes, as well as for other objects of medical and statistical science, for of this they must already be aware; but as hitherto that detailed information as to the causes of death, which it is reasonable to expect from Members of the Medical Profession in Bombay, has not been satisfactorily supplied, the Right Honorable the Governor in Council considers it necessary to remind the Medical Practitioners of this community that the correctness and value of the Mortuary Registration depend much, in this particular point, on their zealous co-operation.

Blank Forms for Reports of Death may be obtained on application at the Mazagon Police Office.

No. of House	
REPORT OF DEATH.	
Date of Death.....

Cause of Death	
Duration of Disease.....	<div> <div>Years . . .</div> <div>Months ..</div> <div>Days</div> <div>Hours....</div> </div>
Remarks.	

(Signature.)

In entering the Caste of *Hindoo*, *Jain*, or *Lingaet*, specify the particular Subdivision of Caste to which deceased belonged.

Distinguish between *Negro-Africans* and other Musulmans.

In the case of *Christians*, designate those only *Europeans* who are of pure European parentage; those of mixed Indian and European parentage enter as *Indo-Europeans*; and those of pure Asiatic origin as *Native Christians*.

The Report, duly filled in and signed, to be given to the Funeral Party, Undertaker, or Friends, with instructions that it be delivered to the Policeman at the Burial or Funeral-place, at the time of the Funeral.

By order of the Right Honorable the Governor in Council,

(Signed) W. HART,

Secretary to Government.

Bombay Castle, 10th September 1856.

NUMERICAL TABLES.

I.

CLASSIFICATION OF CAUSES OF DEATH.

- I. Cholera.
- II. Small-pox.
- III. Measles.
- IV. Fever.
- V. Disease of the Nervous System.
- VI. „ „ Vascular System.
- VII. „ „ Respiratory System.
- VIII. „ „ Alimentary System.
- IX. „ „ Urinary System.
- X. „ „ Sexual System and Child-bearing.
- XI. „ „ Locomotive and Tegumentary Systems.
- XII. Cachexy and Debility.
- XIII. Leprosy, Tubercular and Articular.
- XIV. Dropsy.
- XV. Accident and Violence.
- XVI. Other and Unknown Cause.

CAUSES OF DEATH among all CASTES and RACES, registered during the Year,
beginning 1st February 1856.

No. 2357 OF 1857.

Bombay, Medical Board Office,

22nd August 1857.

From the SECRETARY MEDICAL BOARD,

To the SUPERINTENDING SURGEON P. D. & I. N.

SIR,

I have the honour, by direction of the Medical Board, to forward the annexed copy of Government Resolution, General Department, No. 2089, dated 20th instant, upon Dr. Leith's Ninth Mortuary Report, for 1856-57, and to beg you will communicate the same to that Officer, with the Medical Board's request that he will be so good as to see the Report through the Press, as he has hitherto so kindly done.

2. The manuscript copy of the Report is herewith returned, to which it is requested the Government Resolution may also be added.

I have the honour to be, &c.

(Signed) W. C. COLES, Assistant Surgeon,
Secretary Medical Board.

No. 2089 OF 1857.

GENERAL DEPARTMENT.

Bombay Castle, 20th August 1857.

To the MEDICAL BOARD.

Letter from the Medical Board, No. 2172, dated the 31st July 1857.

Submit Dr. Leith's Ninth Mortuary Report, for 1856-57.

Resolution of Government on the above, dated the 17th August 1857.

The thanks of Government should be conveyed to Dr. Leith, through the Medical Board, for the valuable information furnished in his Report

and its Appendices, which should, as usual, be printed on account of Government.

2. Government are glad to learn that a more correct registration of deaths has been the result of the measures adopted last year for the purpose, thus rendering the present Mortuary Report more complete than heretofore.

3. With reference to the extract noted in the margin, the Medical Board

“As the mortality from Cholera seems to depend so much on the moisture or dryness of the soil, it is a matter of grave importance that the efficiency of the drainage of the Island shall at least keep pace with the increased influx of water which will come from the Vehar Works.”

should be informed that the subject of reforming the drainage of the Town and Island of Bombay has lately been under the consideration of this Government, and has been referred to the Government of India.

(True copy)

(Signed) W. HART,

Secretary to Government.

TENTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1857.

DURING the year which ended 31st January last, the registered deaths from all causes were 17,543, or, exclusive of Still-born, they were 17,210; of which 9,544 were males and 7,666 were females, being in the proportion of 124·5 of the former to 100 of the latter. The Still-born were 191 males and 142 females, or 333 in all.

2. Bombay was reported to have been the birth-place of 8,663, while 8,835 were said to have been born elsewhere, and of 45 the place of birth was unknown. The families of but 3,620 were stated to belong to this Island, those of 13,878 belonged to other places, and of 45 the families were unknown. There were buried 10,976; burnt 5,751; and exposed to Vultures 816.

3. The increased aid of the Medical Practitioners, which was given at the close of the year 1856 in response to the Government Circular, was continued for a few months, and the proportion of written Reports of Death is again one-seventh; had the effort been sustained, they would have been nearly a fifth of the whole.

4. The high mortality was participated in by all the various classes of disease, excepting those of Cholera, Small-pox, and diseases of the Respiratory Organs, in which the fatal casualties registered were below the average. The year's mortality was chiefly marked by a severe epidemic visitation of Measles. This disease was rapidly increasing in prevalence at the close of

the preceding year; it advanced to its maximum in March, and then declined, until September, when it became extinct, having, from the 1st February, carried off 1,609 persons, or altogether 1,772 from the outbreak of the Epidemic at the close of the preceding year. As is usual in Measles, its severity was greatest at the lower ages, and 86 per cent. of the deaths were in children below seven years of age, and 96 per cent. below the age of fourteen years.

5. The deaths from Cholera were 1,741, and from Small-pox 396, both numbers being much below the mean of former years. The total mortality from the three Epidemic classes was 3,751.

6. From the common or sporadic causes there were 13,459 deaths, of which 7,884 were attributed to Fever; 621 to diseases of the Brain and Nervous System; and 34 to those of the Heart and Vascular System. The number under diseases of the Respiratory Organs was 1,031, the lowest that has been registered—of course this does not include the cases in which Bronchitis or Pneumonia supervened on Measles; the deaths in all such were entered under the head of the primary disease. The deaths (2,078) from Ailments of the Bowels and other Alimentary Organs were above the mean number; still the reported deaths in Class IX were few. From diseases of the Sexual System and Child-bearing there were 139; and from Class XI there were 99. The great increase in the entries under Debility gives reason to suspect a want of diligence on the part of those who receive the Reports of Death at the funeral-places; the whole number in Class XII was last year 1,154, or 430 above the average. There were 29 deaths from Leprosy, 179 from Dropsy, 175 from Violence and Accident, and 19 from causes undetermined.

7. Ten years of the Registration are now completed, and much that is interesting and of importance to Medical and Statistical Science is recorded. Exclusive of Still-born, 147,950 deaths have been registered, and from the facilities afforded by insular position, and from the plan of registration followed, such is believed to be nearly the true mortality. A small deficiency in the Death Reports of young infants was detected, and was mentioned in former yearly Reports; but now the Police are empowered, by a recent Act of the Legislative Council, to put a stop to domiciliary interments.

8. The information recorded as to Sex, Caste and Race, Occupation,

and Locality of Residence, are believed to be accurate; that as to Age is only approximatively so.

9. The reports of "*Cause of Death*" are, in many points, unsatisfactory, as from time to time has been stated. The mortality from Cholera, Small-pox, and Measles is thought to be given with near approach to accuracy, and the entries in Class XV, that of Accident and Violence, are correct. Class IV doubtless contains much more than Idiopathic Fever, and the numbers are, consequently, too low in Classes V, VII, and VIII. It is probable that Tetanus and Convulsions are sometimes confounded together. In referring to the specific diseases in Class VII it must not be supposed that Bronchitis and Pneumonia are of rare occurrence, from the small numbers that are opposite these headings; many cases are most probably included under the general term *Respiratory Disease*. From the Mortuary Register it is seen that the climate of Bombay, with its mean temperature of 80° Fahr., and a mean daily range of 11½° Fahr., gives considerable immunity from Pulmonary Disease; but the impure air of the small, unventilated, and often crowded sleeping-places of the majority of the Native part of the population, must act prejudicially, and lessen, it is thought, the advantages that temperature would otherwise give. In Class VIII also the deaths specified as from Dysentery are not all that occurred from that disease; many cases that had become chronic were most probably returned under the designations Diarrhœa and Bowel Complaint. The smallness of the numbers met with in Classes VI and IX has several times, in former Reports, been alluded to, and reasonably attributed to inability, on the part of those reporting the deaths, to detect the diseases belonging to those classes. Class X is probably deficient, through dislike in some to state the true cause of death when it is of this class. Were the diagnosis more carefully made, there would be fewer deaths of children returned under the slovenly term *Debility*. It is probable that Class XIII does not contain so many as it ought, as the termination of Leprosy by Diarrhœa or Dysentery is likely to be the occasion of some deaths which belong to it having been referred to Class VIII.

10. Success has not yet attended the attempts that have been made to trace a connexion between meteorological movements and the variations in the amount of mortality here in different years. That atmospheric changes

do affect the health is obvious, and that sickness thus produced may terminate fatally, does not admit of reasonable doubt; but from the varying duration of many diseases thus produced, and their liability to modification and to complication by other than atmospheric influences, it is not easy, from ordinary Mortuary Registers, to determine truly the effects on mortality of variations in different years in the temperature, moisture, movement, or pressure of the air. A perfect knowledge of the effects of the vicissitudes of weather on the progress of diseases as they occur in this climate, would, doubtless, be a valuable addition to the Natural History of Disease, and although this can be best prosecuted by observing the diseases in their beginning and progress, the attempt to trace their connexion with the fatal issue from the information registered at the funeral-places may still be persevered in.

11. What is of more immediate local and practical importance is, to find out the localities in the Island where endemic and epidemic disease is most prevalent, that these places may be avoided, or that proper means may be used for their sanitary improvement. The minuteness with which these Mortuary Tables have been prepared has had reference to this; and when it is ascertained how many lives, at different ages, are at risk in each district, then at once can be answered the questions so often asked as to the insalubrity or otherwise of different localities. Information regarding the mortality in each Street, as well as District, is contained in the Registers, and, when called for, can be reduced to Tables. The boundaries of the Districts of the Island, as they have existed during the past ten years of this Registration, are given in an Appendix to this Report.

12. However desirous one may be to place the figures of the Mortuary Registration in juxtaposition with Population Returns, it is better yet to wait in expectation of a trustworthy Census, than to promulgate error, by basing calculations on either of the notoriously incorrect Censuses of 1849 and 1851. The hopelessness of deducing any sure approximation to the total number of the inhabitants from the number of Deaths is manifest, as a slight difference in the assumed rate of mortality produces a great discrepancy in the results; as for example, if the rate of mortality at different ages, and in different sexes, for the whole of England, be applied to the mean of the last five years' deaths here, it gives a population of 987,086; or, if thinking that rate too favourable to adopt, the mean rate in very unhealthy Liverpool

during the seven years, 1838 to 1844, be used, it gives here a population of only 670,290, the difference between the products being nearly 317,000.

13. During the ten years the annual mortality has been increasing, and in comparing the mean of the first five with that of the last five of those years, it is found that there is an excess in the latter of about 2,000, which belongs, not to the fluctuating Epidemic classes, but to the more permanent causes of death. This increase accords with many other circumstances, which indicate a rapid increase in the population.

14. The Tables of Occupations are made with reference to general statistics, rather than to show the effect of various trades and professions on health, which, in a former Report, was stated to be here almost impracticable. In those Tables the deaths are arranged according to the trade or occupation which was *the source of livelihood*, whether the deceased laboured personally in that occupation, or was maintained by a parent or other relative deriving the means of the maintenance from that occupation.

15. Taking the comparative number of deaths as indicative of the comparative number of lives at risk, we find progressive increase during the ten years in the various trades likely to be in demand in an increasing city : it is found in the Labourers, Masons, Workers in Wood and in Iron ; in those furnishing the means of conveyance, as Bullock-drivers, those employed about Horses, and Porters ; in the maritime population also, and those deriving their livelihood from the Book-trade and the Press,—perhaps it is in relation to this that the “ *Writers and Accountants* ” have not increased. The Grain-dealers and the Retailers of Tobacco, Opium, and Gunja have increased, but the number connected with the production and sale of Spirits has diminished. The Butchers have remained stationary, and the Bakers, Grain-parchers, and Confectioners have diminished ; Beggars and Vagrants are among those who have increased in numbers.

16. After arranging the deaths that have been reported during the last two years, according to the languages spoken by those of the various Castes and Races to which the deceased belonged, it has been roughly estimated that in every 1,000 of the inhabitants, Murathee is spoken by 480 ; Guzerathee and its dialects by 244 ; Hindoostanee or Hindee by 205 ; Canarese, Telingee, &c. by 16 ; Arabic, Persian, Beloochee, &c. by 7 ; Portuguese and its *patois*, by 26 ; and English, or other European languages by 22.

17. If, to facilitate the examination of the results of the ten years' Mortuary Returns, the numbers be laid down in linear projection, it is seen that in the curve delineating the deaths from All Causes, there are two maxima: the first in January and the second and greater in April; while the minima are—the first in February, and the second, which is by far the lower, in October.

18. If, after eliminating the deaths belonging to the three Epidemic classes, the delineation of the remaining mortality be made, there are found to be three maxima, which fall respectively in January, May, and August; and three minima, which are in February, June, and September. These three waves are produced by great Fever mortality in May, towards the close of the hot season; from numerous deaths in August towards the close of the Rains, from Cachexiæ and diseases of the Alimentary Organs, which latter class, along with Fever, contributes to form the third and greatest wave in January, or towards the close of the season when miasmata are supposed to be most active, and when the diurnal ranges of temperature and humidity are greatest.

19. When the deaths from Small-pox (which amounted in ten years to 6,610) and those from Measles, 2,362, are severally projected in a linear form, it is seen that there is one maximum of mortality in April, and a minimum in October in the former, and one maximum in March and one minimum in September in the latter, and that the rise and fall of the curves are very regular; and it is seen, on laying down the yearly deaths, that the curves in them correspond with those of the decennium. This yearly regularity is best seen in Small-pox, of which the cases registered have been the more numerous. A linear table of the Small-pox deaths is appended to the end of this Report.

20. The periodicity observed here in these diseases is very remarkable, and its cause is worthy of being sought for. Similar periodicity in Small-pox and Measles mortality is not found in all countries; for on examining the Reports of the Registrar General of England, it is found that the 6,860 Small-pox deaths in London in the nine years—from 1846 to 1854—were distributed as follows:—in the quarter ending 31st March 1,619 deaths; in that ending 30th June 1,721 deaths; in that ending 30th September 1,651; and in the quarter ending 31st December 1,879; or, in the six months,

from 1st January to 30th June, there were 3,340 deaths, and in the other six months 3,520 deaths. The deaths from Measles in London during the same nine years were 10,126, and were distributed in the successive quarters of the year :—thus first 2,483 ; second, 3,772 ; third, 2,030 ; and fourth 2,841.

21. If, from different quarters of the world, there is any precise information on the subject on record, it does not appear to be at present accessible in Bombay. In the Parliamentary Returns on the Health of Troops on the West Coast of Africa in the Sierra Leone Command, there is mention made of two Epidemics of Small-pox, both of which were present in the Spring months; the Latitude was about 8° N.

22. It is worthy of inquiry whether the periodicity now mentioned always accompanies the disease in tropical climates, and whether there is any regular ratio in which the manifestation of periodicity diminishes on receding from the Equator; and also whether the law effects the time of prevalence of the disease in the Southern Hemisphere. No precise information on this latter point has been found; but from meagre incidental notices that have been met with in books of travels in South Africa and South America, it is probable that our seasons of increase and decrease are not there reversed.

23. The progress of the disease is not affected by temperature, for its advance is not impeded by the increasing cold of November, December, and January, nor by the rising temperature of the succeeding month. Nor is the periodicity dependent on the changes in the Sun's declination, as the disease advances while the southern declination is increasing, and does not cease to advance at the Solstice, but is still progressive while the southerly declination is again diminishing, and attains its maximum when the declination is near Zero.

24. In recent investigations connected with terrestrial magnetism, it has been observed that a marked influence attends the passage of the Earth through the points in its orbit, at which the plane containing the Sun's axis is perpendicular to the Ecliptic, and the times of that passage are about ten days before the Equinoxes: the poles of the sun lean more towards the Earth at those than at other epochs. It is to this annual period that the Small-pox mortality conforms itself, although the solar influence produces in it but

one maximum and one minimum; while, in the magnetic variations, it causes two of each, one of the minima coinciding in time with the maximum of Variola. The power retarding the prevalence of Small-pox (and of Measles also) is coincident in time with the Earth's approach to the Sun's pole in September. This retarding or adverse power is found to be greatest at the Autumnal Equinox, and, after regularly progressive diminution, to be least at the Vernal Equinox, when the Earth approaches the other pole of the Sun, from which time the retarding influence increases, until it has again, in September, reached its maximum. In the Mortuary Tables we have only the date of death, but the Registers from which these Tables are compiled, give also the duration of the fatal attack in each case; and the mean duration during a short period has been elaborated and found to be ten-and-a-half days, which, added to the days that may be allowed for the incubation of the disease, would bring the maximum of attacks to very near coincidence with the Sun's periods.

The Small-pox deaths in ten years were, in

January	372
February	695
March	1,338
April	1,559
May	1,212
June	727

Total..5,903

in the six months on the side
of the Vernal Equinox.

The deaths from Measles in ten years were, in

January	164
February	399
March	603
April	571
May	327
June	155

Total..2,219

in the six months on the side
of the Vernal Equinox.

July	309
August	138
September	72
October	42
November	46
December	100

Total.. 707

in the six months on the side
of the Autumnal Equinox.

July	44
August	25
September	2
October	12
November	20
December	40

Total.. 143

in the six months on the side
of the Autumnal Equinox.

25. It is likely that the periodicity of Fever, both in its seasonal prevalence and in its diurnal phenomena, may yet be found to be due to influences connected, or concomitant, with the magnetic changes in the Earth and the atmosphere; and it is probable, also, that the periodicity in Croup, which has its time of accession and its critical hours, synchronous with the waves of the barometric tide, may find in the magnetic changes of the atmosphere, a predisposing cause more satisfactory than the mere variations in the pressure of the air. These latter points, however, require clinical observation for their elucidation.

26. In the Cholera mortality there are no regular annual times of maxima and minima; and in looking at the Returns of the successive years, the outbreaks or exasperations of the disease, as indicated by the deaths, are seen to have taken place at apparently irregular periods. If, however, the aggregate of the deaths in the ten years be taken, there are found to be two maxima and two minima, and these nearly coincide with the maxima and minima of the Fever mortality, and one of the maxima and one of the minima agree nearly with those of Small-pox and Measles.

27. In several of the epidemic visitations of Cholera, a very minute examination of the daily Meteorological Observations was made with reference to the progress of the mortality from the disease, but no causal connection between them was detected. The influence of locality of residence on the mortality from this disease has often been pointed out in former Reports.

28. The deaths from diseases of the Brain and Nervous System during the ten years amounted to 5,659, and there was not any well-marked regularity in either their annual or monthly fluctuations. The mortality, 14,053, from diseases of the organs of Respiration, was distributed with much equality through the different months, although the sum, in various years, varied considerably; the proportion to the total mortality was 9·5. The fatal casualties from diseases of the Alimentary Organs were 19,579, or about 1,958 a year, or 13·2 of the total deaths, the maxima falling, as before stated, in January and August. The numbers recorded during the ten years in Classes VI, IX, and X, were 169, 153, and 1,114; and, as was before mentioned, these are below the reality. The number from diseases of the integuments, muscles, bones, and joints, was about 61 a year, or 609 in all; and of these 159, or nearly 25 per cent., were from Guinea-worm. If

those in Class V, under Traumatic Tetanus which originated from this parasite of the integuments, be added, there appear 194 deaths from this cause. From diseases of the General System, such as Scurvy, Beriberi, Rheumatism, Cancer, Syphilis, &c., and the doubtful cases included under the term *Debility*, there were 7,244 reported deaths. The yearly mean would, of course, be 724, but the entries during the last two years of the decennium greatly exceed the average. From Leprosy there were 425, from Dropsy 1,772, and from Other and Unknown Causes 237, in the ten years. This last number is made up chiefly of cases of infants and strangers found dead, those reported by the Coroner "Natural Death," "Sudden Death," and a few in which the persons furnishing the report had omitted to state the disease that preceded death, and had in its place written "*Old Age*," or the more learned, but equally uninformative term "*Senectus*," which was superfluous, as the age was at the same time particularly given, as usual, in another line of the same Report.

29. In Class XV, that of Violent Deaths, there were 1,488, or about 149 a year. Of these some were from causes peculiar to this country, such as the 29 instances of Snake-bite, and the 46 deaths from falls from Palmtrees—these latter occurring among men whose occupation it is to tap the trees. There were 17 deaths reported as having resulted from Mercurial Ptyalism, probably through the abuse of mercury by Native Medical Practitioners.

30. There were 77 reported to have died from having been run over, or injured in the streets, by carriages and carts. There were 606 drowned, of which number 180 were so in the sea, and of these 47 lost their lives in the Harbour during the hurricane of 1st and 2nd November 1854. In tanks, wells, and pools there were 426 drowned, many of them by suicide. The Suicides recorded in the ten years were as follows:—

SUICIDES

SUICIDES in BOMBAY during Ten Years—1848 to 1857.

MEANS USED.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.	January.	Ten Years
Drowning in tank, well, pool	2	5	3	1	3	10	14	18	20	10	12	3	101
" in the sea.....	1	1	..	4	2	..	1	9
Poisoning	1	3	6	6	3	3	9	3	3	4	3	2	46
Hanging	2	3	..	1	2	..	2	4	..	14
Precipitation into a quarry	1	1
Throat-cutting	3	2	2	1	1	1	1	1	1	13
Stabbing and cutting	1	1	2
Gun-shot, Pistol-shot	2	3	1	1	..	1	2	2	1	13
ALL MEANS.....	6	15	15	8	11	15	26	23	29	21	22	8	199
Drowning in tank, well, or pool	2	5	3	1	3	10	14	18	20	10	12	3	101
Other means	4	10	12	7	8	5	12	5	9	11	10	5	98

31. From this table it appears, as was stated in the Report for 1852, that Suicides are increased by the facilities afforded by ill-fenced or ill-guarded tanks and open wells, as it is in the months when the water in these is most abundant that Suicides are most numerous.

32. The violent deaths reported as Homicidal were 71, and were inflicted by the following means :—

Blows with various weapons, and kicks	15	Hanging	3
Decapitation	1	Strangulation	5
Drowning in the sea	7	Suffocation.....	4
Drowning in tanks	6	Poisoning by Arsenic ..	2
Exposure	1	Gunshot.....	3
Fall, precipitation	2	Throat-cutting	6
		Stabbing and cutting ..	16

33. In reviewing the ten years' deaths in reference to the Races and Castes of the deceased, there is seen no reason for supposing that any have absolute exemption from any of the forms of disease. The liability, however, to certain diseases seems to differ in different classes of the people. The Tables of Caste and Race were, from the beginning of the Registration, arranged with a view to obtain information on this point; and although after the first three years' alterations were made in these Tables, the distinction between those allowed by their religion to eat flesh and those forbidden

to do so, has been strictly observed from the first. Those who religiously abstain from eating the flesh of animals are the Jains, Brahmuns, Lingacts, and Bhatias; the deaths among these *Asarcophagous* tribes were, exclusive of Still-born, 12,532, or $8\frac{1}{2}$ per cent. of the whole. There is no religious obligation on the other Castes or Races of the people to abstain from animal food, and they are all classed together as *Sarcophagous*; but, although their religion does not enforce it, many of the Hindoos of other castes are, from the constraint of poverty, strangers to the use of animal food, and, like those of the *Asarcophagous* class, make use of various pulses in their diet, to supply the demand of the body for nitrogenous aliment. For this reason the distinction between the two classes is less strict than could be wished, and, perhaps, the contrast between the two is less marked than it would otherwise have been.

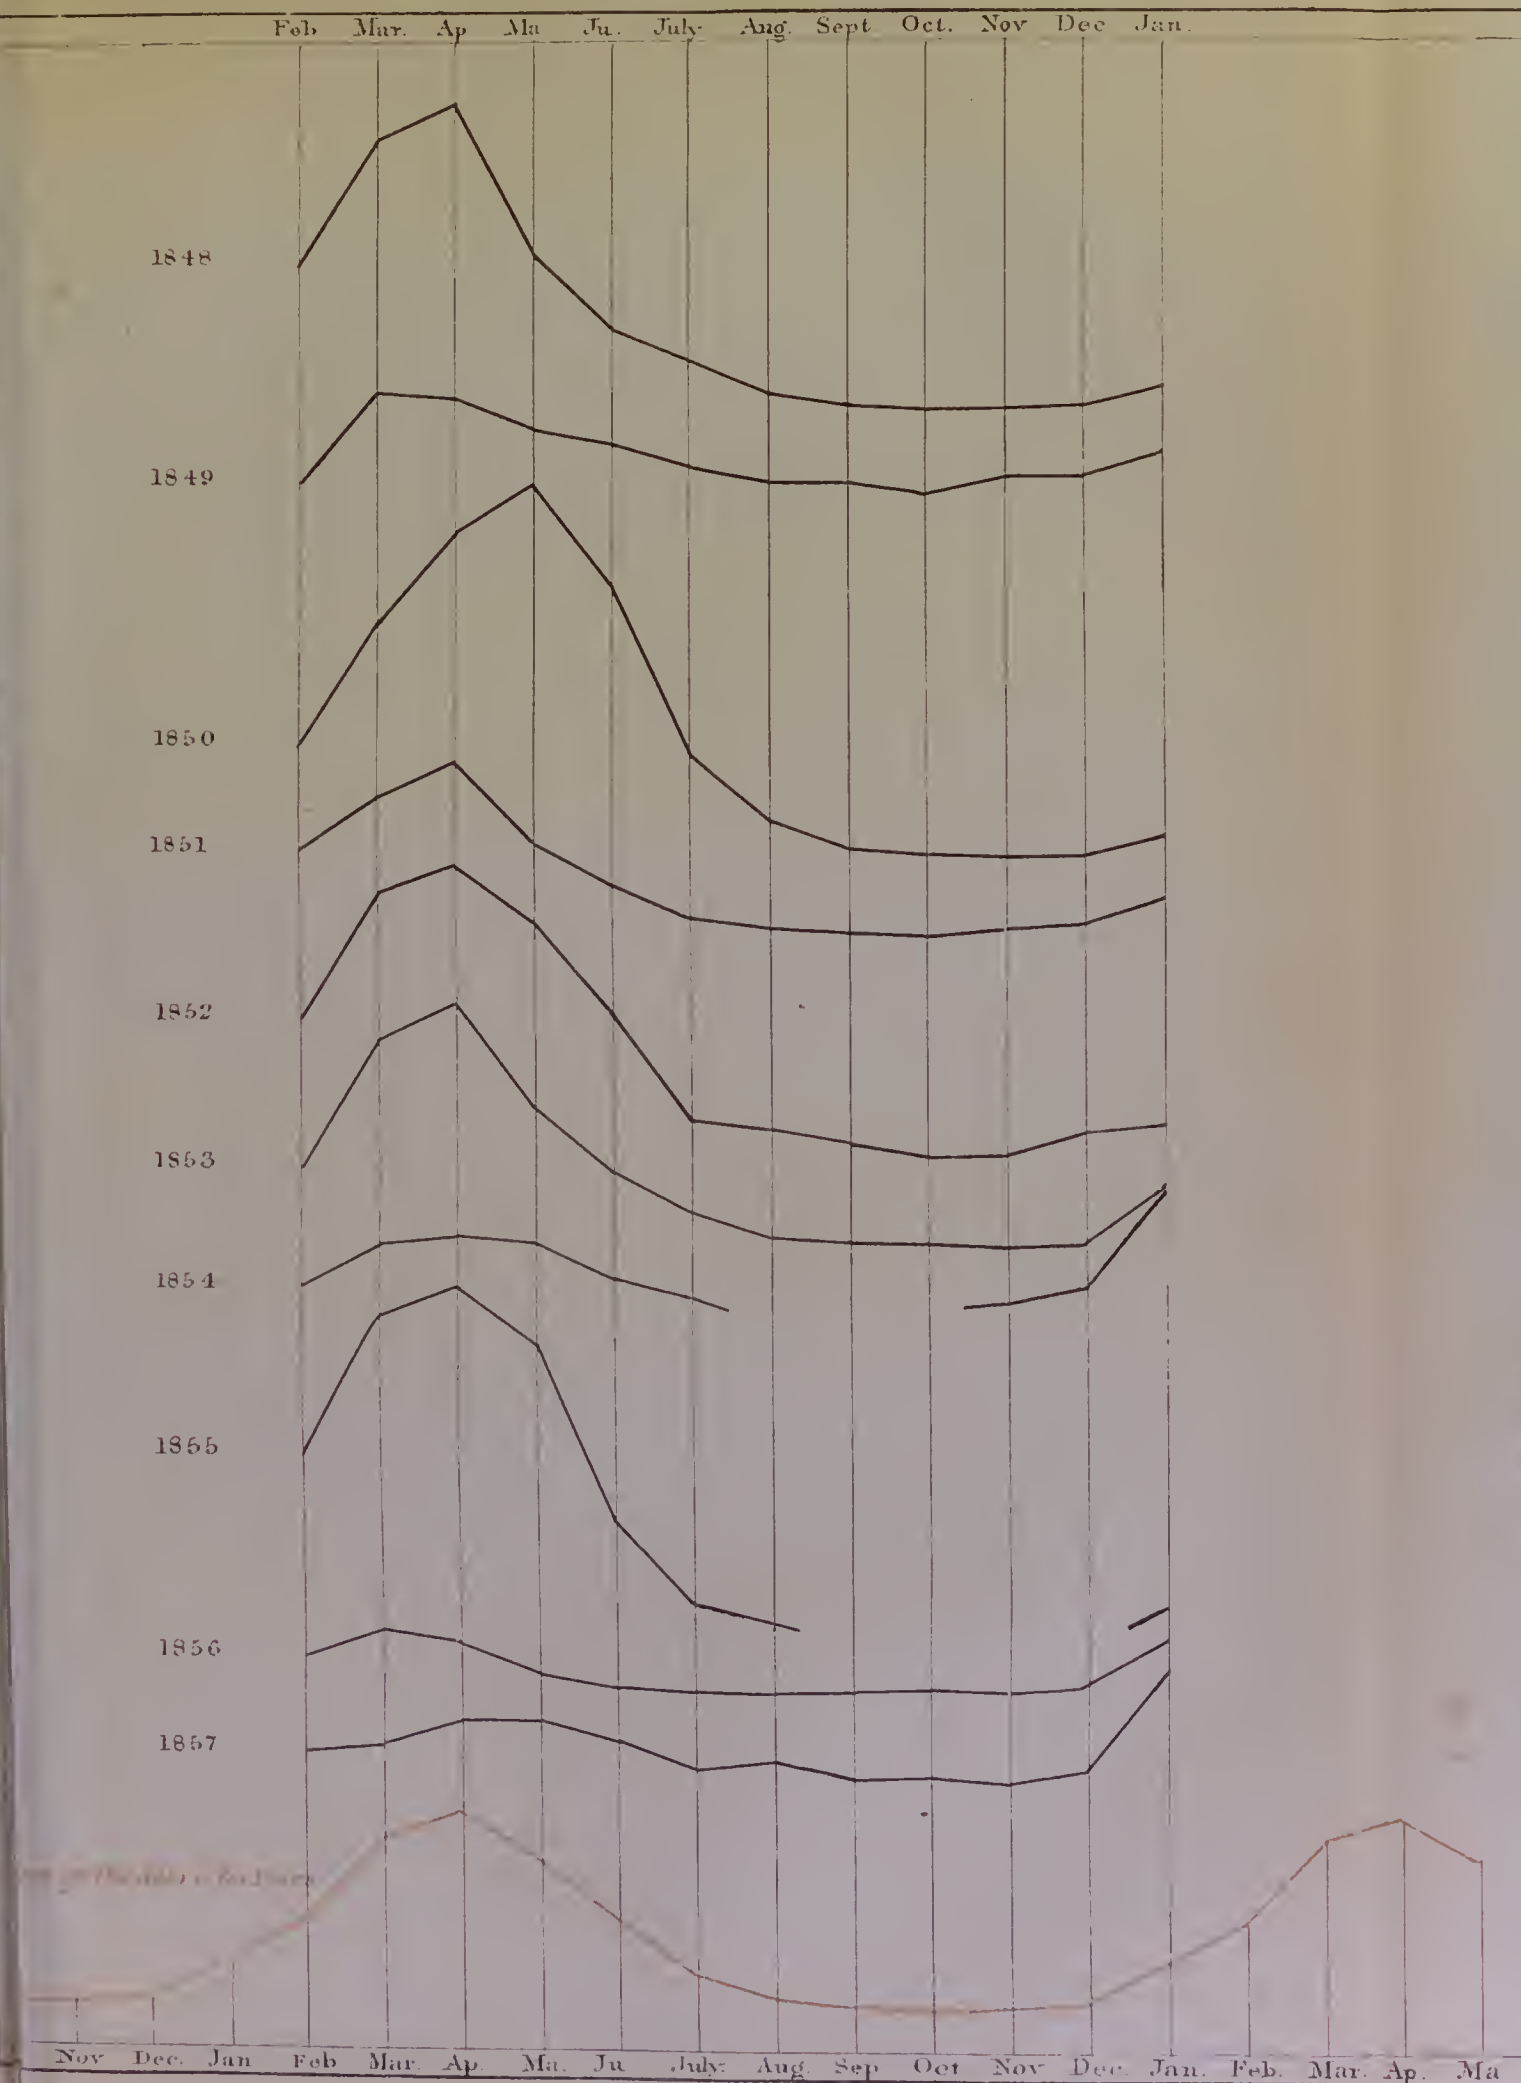

34. Among the *Asarcophagous*, the deaths from Cholera were 7·1 per cent. of the whole, from Small-pox 3·1 per cent., and from Measles 0·7 per cent. While among the *Sarcophagous*, 135,427 in all, the percentage from Cholera was 16·0, from Small-pox 4·6, and from Measles 1·7. It has to be borne in mind, while making this comparison, that as Small-pox and Measles are diseases that chiefly affect children, the difference may possibly be owing, in some measure, to a difference in the proportion of children in the different tribes residing in Bombay with their parents, for many adults sojourn here while their families remain at their distant homes.

35. If the deaths from Cholera, Small-pox, and Measles be put aside, and those from All Other Causes be examined, we find among the 11,162 Pulse-eaters 63·1 from Fever; while among the 105,280 Flesh-eaters, the proportion is but 54·1 per cent.; from diseases of the Nervous System in the *Asarcophagous* 4·1, in the *Sarcophagous* 5·0. The *Asarcophagous* class seems more subject, than the other, to Pulmonary diseases, the deaths in the former being 13·3, and in the latter 11·9; while, on the other hand, the *Sarcophagous* had 17·5 per cent. from diseases of the Alimentary System, and those who do not eat flesh only 10·4. The deaths from Cachexy and Debility were 4·8 among the *Asarcophagous*, and 6·4 among the *Sarcophagous*.

SOUTH

BOUNDARIES

OF THE

REGISTRATION DIVISIONS AND SECTIONS.

The united Islands of Bombay and Colaba are parted, for Police and Registration purposes, into six *Divisions*, which are distinguished severally by the six first letters of the Alphabet; and the Harbour forms a seventh, called the *Water Division*.

The six lettered Divisions into which the land is divided, are subdivided into *Sections*, or Districts, each of which is both named and numbered. There is no subdivision of the *Water Division*.

A DIVISION includes Colaba and that part of the Island of Bombay lying South of *Esplanade Cross-Road* and *First Marine Lane*; the former of which roads separates it from Division **B**; and the latter separates it from Division **C**.

SECTION 1st.—**COLABA**—formerly an Island, is still surrounded by sea, excepting on the North, where it is bounded by the *Colaba Vallade* or Causeway, and land recovered from the Sea, which separate it from the *Esplanade*, or Section 2nd of Division **A**.

SECTION 2nd.—**FORT**—is bounded on the East by the Harbour, and elsewhere by the Ramparts and Ditch, which separate it from the *Esplanade*, or Section 2nd of Division **A**.

SECTION 3rd.—**ESPLANADE**—is bounded on the South by the *Colaba Vallade* and recovered land, which separate it from *Colaba*, or Section 1st of Division **A**; on the East by the Harbour and Fort Ditch, which latter separates it from the *Fort*, or Section 2nd of Division **A**; on the North by *Esplanade Cross-Road* and *First Marine Lane*, the former of which separates it from *Market*, or Section 1st of Division **B**, and *Mandwee*, or Section 2nd of Division **B**; the latter separates it from *Dhobee-tulao*, or Section 1st of Division **C**; on the West by the Sea of Backbay.

B DIVISION is bounded on the South by *Esplanade Cross-Road*, which separates it from Division **A**; on the East by the Harbour; on the North by *Walpaka-*

pee Road, and *Baboola Tank Road*, which roads separate it from Division **E**; on the West by *Kalbadevee Road*, *Mombadevee Road*, and *Bindee Bazar Street*, which separate it from Division **C**.

SECTION 1st.—**MARKET**—is of triangular shape, with the apex to North. It is bounded on the South by part of *Esplanade Cross-Road*, which separates it from *Esplanade*, Section 3rd of Division **A**; on the East and North-East by *Sheik Ibrahim Soobedar Street* (Rungaree Mowla), *Syud Abdool Ruhman Street*, part of *Musjeed Bundur Street*, and *Mombadevee Street*, which separate it from *Mandwee*, Section 2nd of Division **B**; on the West and North-West by *Kalbu-devee Road* and *Mombadevee Road*, which separate it from *Dhobee-tulao*, Section 1st of Division **C**.

SECTION 2nd.—**MANDWEE**—is bounded on the South by part of *Esplanade Cross-Road*, which separates it from *Esplanade*, Section 3rd of Division **A**; on the East by the Harbour; on the North by *Mombadevee Road*, also by *Cross-Road* and *Cobard Bowla Street*, the first of which separates it from *Bhooleshwur*, Section 2nd of Division **C**, and the other two separate it from *Oomburkharee*, Section 3rd of Division **B**; on the West by *Sheik Ibrahim Soobedar Street* (Rungaree Mowla), *Syud Abdool Ruhman Street*, portion of *Musjeed Bundur Street*, and *Mombadevee Street*, all which separate it from *Market*, or Section 1st of Division **B**.

SECTION 3rd.—**OOMBURKHAREE**—is bounded on the South by *Cross-Road* and *Cobard Bowla Street*, which separate it from *Mandwee*, Section 2nd of Division **B**; on the East by the Harbour; on the North by *Walpakadee Road* and *Baboola Tank Road*, both which separate it from *Tarivaree*, Section 2nd of Division **E**; on the West by *Bindee Bazar Road*, which separates it from *Bhooleshwur*, Section 2nd of Division **C**, and *Khara-tulao*, Section 3rd of Division **C**.

C DIVISION is bounded on the South by *First Marine Lane*, which separates it from Division **A**; on the East by *Kalbadevee Road*, *Mombadevee* and *Bindee Bazar Roads*, all which roads separate it from Division **B**; on the North by *Obelisk Road* and *Grant Road*, which separate it from Division **E**; on the West by the Sea at Backbay, also by *Churnee Road*, *Girgaon Portuguese Church Lane*, part of *Girgaon Back Road*, and *Gaumdevee Road*, which roads separate it from Division **D**.

SECTION 1st.—**DHOBEE-TULAO**—is bounded on the South by *First Marine Lane*, which separates it from *Esplanade*, Section 3rd of Division **A**; on the East by *Kalbadevee Road*, which separates it from *Market*, Section 1st of Division **B**; on the North by *Agiaree Lane*, *Portuguese Church Lane*, and *Thakoorwaree Lane*, the first of which separates it from *Bhooleshwur*, Section 2nd of Division **C**, the last separates it from *Girgaon*, Section 4th of Division **C**; on the West by the Sea at Backbay.

SECTION 2nd.—**BHOOLESHWUR**—is bounded on the South by *Agiaree Lane*, which separates it from *Dhobee-tulao*, Section 1st of Division **C**; on the East by *Kalbadevee Street*, *Mombadevee Row*, part of *Bindee Bazar Road*: the first two separate it from *Mandwee*, Section 2nd of Division **B**, the last separates it from *Oomburkharee*, Section 3rd of Division **B**; on the North by *Erskine Road*, *Cowasjee Patell Tank Road*, which separate it from *Khara-tulao*, Section 3rd of Division **C**; on the West by *Portuguese Church Street*, which separates it from *Girgaon*, Section 4th of Division **C**.

SECTION 3rd.—**KHARA-TULAO**—is bounded on the South by *Erskine Road*, *Cowasjee Patell Tank*, and part of *Girgaon Back Road*, which separate it, the former, from *Bhooleshwur*, Section 2nd of Division **C**, the last from *Girgaon*, Section 4th of Division **C**; on the East by part of *Bindee Bazar Road*, which separates it from *Oomburkharee*, Section 3rd of Division **B**; on the North by *Obelisk Road* and part of *Grant Road*, which separate it from *Kamateepoora*, Section 3rd of Division **E**; on the West by *Trimbuk Purshotum Street*, which separates it from *Girgaon*, Section 4th of Division **C**.

SECTION 4th.—**GIRGAON**—is bounded on the South by *T,hakoor-waree Lane*, which separates it from *Dhobee-tulao*, Section 1st of Division **C**; on the East by *Ardesir Dady Street* and *Trimbuk Purshotum Street*, the former of which separates it from *Bhooleshwur*, Section 2nd of Division **C**, the latter separates it from *Khara-tulao*, Section 3rd of Division **C**; on the North by part of *Grant Road*, which separates it from *Kamateepoora*, Section 3rd of Division **E**; on the West and South West by *Backbay*, *Churnee Road*, *Girgaon Portuguese Church Lane*, *Girgaon Back Road*, and *Gaumdevee Road*, which roads separate it from *Chaoputee*, Section 1st of Division **D**.

D DIVISION includes all between *Malabar Point* and the middle of *Hornby Vallade*, it has the sea on its South, West and North, and is bounded on the East first by *Churnee Road*, *Girgaon Portuguese Church Lane*, and *Girgaon Back Road*, which separate it from Division **C**; and then by a line along *Tardeo Road*, as far as *Bellasis Road*, and from thence Northward by the Main Drain, which line separates it from Division **E**.

SECTION 1st.—**CHAOPUTEE**—is bounded on the South by Sea of Backbay; on the East by *Churnee Road*, and *Girgaon Portuguese Church Lane*, which separate it from *Girgaon*, Section 4th of Division **C**; on the North by part of *Girgaon Back Road*, which separates it from *Girgaon*, Section 4th of Division **C**; on the West by *Gaumdevee Road*, which separates it from *Walkeshwur*, Section 2nd of Division **D**.

SECTION 2nd.—**WALKESHWUR**—is bounded on the South by the Sea; on the East by Sea and *Gaumdevee Road*, which latter separates it from *Chaoputee*, Section 1st of Division **D**; on the North by *Gaola-tulao Road*, which separates it from *Mahaluxmee*, Section 3rd of Division **D**; on the West by Sea.

SECTION 3rd.—**MAHALUXMEE**—is bounded on the South by *Gaola Tank Road*, which separates it from *Walkeshwur*, Section 2nd of Division **D**; on the East by *Tardeo Road* Northward, as far as *Bellasis Road*, and thence further Northward by the Main Drain, which separate it from *Kamateepoora*, Section 3rd of Division **E**; on the North by Sea and the boundary line of division running Northward from middle of *Hornby Vallade*, which separate it from *Wurlee*, Section 3rd of Division **F**; on the West by Sea.

E DIVISION is bounded on the South by *Walpakadee Lane*, *Baboola Tank Road*, and by *Obelisk* and *Grant Roads*. The two first separate it from Division **B**, the two last separate it from Division **C**; on the East by the Harbour; on the North by a line drawn from the middle of *Hornby Vallade* to *Bhoeewaree*, North of *Parell Tank*, and onwards to the Harbour, which line separates it from Division **F**; on the West by part of *Tardeo Road*, and from *Bellasis Road* Northward by the Main Drain, which separate it from Division **D**.

SECTION 1st.—**MAZAGAON**—is bounded on the South by *Walpakadee Lane*, which separates it from *Oomburkharee*, Section 3rd of Division **B**; on the East by the Harbour; on the North by line along Northern boundary of *Powder Works* to *The Mount*, which line separates it from *Seoree*, Section 5th of Division **E**; on the West by *Mount Lane*, which separates it from *Tarwaree*, Section 2nd of Division **E**.

SECTION 2nd.—**TARWAREE**—is bounded on the South by *Baboola Tank Road*, which separates it from *Oomburkharee*, Section 3rd of Division **B**; on the East by *Mount Lane*, which separates it from *Mazagaon*, Section 1st of Division **E**; on the North by *Mount Road*, which separates it from *Parell*, Section 4th of Division **E**; on the West by part of *Parell Road*, which separates it from *Kamateepoora*, Section 3rd of Division **E**.

SECTION 3rd.—**KAMATEEPOORA**—is bounded on the South by *Grant* and *Obelisk Roads*, the former separating from it *Girgaon*, Section 4th of Division **C**, the latter separating it from *Khara-tulao*, Section 3rd of Division **C**; on the East by the *Parell Road*, which separates it from *Tarwaree*, Section 2nd of Division **E**; on the North by line drawn from West end of *Mount Road*, which line separates it from *Parell*, Section 4th of Division **F**; on the West by South part of *Tardeo Road*, and North part of Main Drain, which separate it from *Mahaluxmee*, Section 3rd of Division **D**.

SECTION 4th.—**PARELL**—is bounded on the South by *Mount Road*, and a line from thence drawn Westward, which road separates it from *Tarwaree*, Section 2nd of Division **F**, and which line separates it from *Kamateepoora*, Section 3rd of Division **E**; on the East by *Gorupdevee Road* and *Parell Tank*, which separate it from *Seoree*, Section 5th of Division **F**; on the North by line from *Bhoeewaree*, North of *Parell Tank*, to *Parell Road*, which line separates it

from *Seo*, Section 1st of Division **F**; on the West by North part of Main Drain and line drawn from middle of *Hornby Vallade* to *Parell*, the part of the Drain separating it from *Mahaluxmee*, Section 3rd of Division **D**, and the line mentioned, separating it from *Wurlee*, Section 3rd of Division **F**.

SECTION 5th.—**SEOREE**—is bounded on the South by a line along North boundary of *Powder Works* to *The Mount*, which line separates it from *Mazagaon*, Section 1st of Division **F**; on the East by the Harbour; on the North by line from *Bhoeewaree* to north of *Seoree Fort*, which line separates it from *Seo*, Section 1st of Division **F**; on the West by *Gorupdevee Road* and road leading on to *Parell Tank*, which separate it from *Parell*, Section 4th of Division **E**.

F DIVISION includes all that part of the Island north of a line drawn from the middle of *Hornby Vallade* by *Parell*, *Bhoeewaree*, north of *Seoree Fort* to the Harbour, which line separates it from the **D** and **E** Divisions.

SECTION 1st.—**SEO**—is bounded on the South by a line drawn from *Bhoeewaree Road* to the Harbour, which line separates it from *Seoree*, Section 5th of Division **F**; on the East by the Sea; on the North by Sea and Causeway, which separate it from Island of Salsette; on the West by *Parell Road*, and a line northward, along the Drain to *Dharavee*, which separate it from *Mahim*, Section 2nd of Division **F**.

SECTION 2nd.—**MAHIM**—is bounded on the South by a line from *Parell* to *Wurlee Sluice*, which line separates it from *Wurlee*, Section 3rd of Division **F**; on the East by *Parell Road* and Drain running northward to *Dharavee*, which separate it from *Seo*, Section 1st of Division **F**; on the North by Sea, which separates it from *Salsette*; on the West by the Sea.

SECTION 3rd.—**WURLEE**—is bounded on the South and East by a line from middle of *Hornby Vallade*, which line separates it from *Mahaluxmee*, Section 3rd of Division **D**, and from *Parell*, Section 4th of Division **F**; on the North by a line from *Parell* to *Wurlee Sluice*, which line separates it from *Mahim*, Section 2nd of Division **F**; on the West by the Sea.

WATER DIVISION includes all the Shipping in the Harbour.

No record of Solar Radiation is made at the Observatory.

No. 1846 OF 1858.

From the SECRETARY DIRECTOR GENERAL MEDICAL DEPARTMENT,

To the SUPERINTENDING SURGEON, P. D. & I. N.

Bombay, 28th July 1858.

SIR,

I have the honour, by desire of the Director General, to forward the subjoined copy of Government Resolution, No. 1843, dated 27th instant, upon Dr. Leith's Mortuary Report for 1857-58, and to beg you will communicate the same to that Officer, with the Director General's request that Dr. Leith will be so good as to see it through the Press, as he has kindly done in former years.

2. The manuscript copy of the Report is herewith returned, to which it is requested my letter, No. 1720 of 1858 (copy of which is attached), and the Government Resolution, may also be added.

I have the honour, &c.

(Signed) W. C. COLES, Assistant Surgeon,
Secretary.

No. 1720 OF 1858.

From the SECRETARY DIRECTOR GENERAL MEDICAL DEPARTMENT,

To the SECRETARY to GOVERNMENT, General Department.

Bombay, 9th July 1858.

SIR,

In forwarding, for submission to the Right Honorable the Governor in Council, Dr. Leith's Annual Mortuary Returns and Report for 1857, dated 5th instant, I have the honour, by desire of the Director General Medical Department, to request that, as heretofore, permission to have printed the usual number of copies, and in the usual manner, may be granted.

2. On the present occasion Dr. Leith has enhanced the value of his Annual Report by reviewing some points of interest and importance, which the completion of ten years' Registration has enabled him to summarise.

3. It is unnecessary for the Director General to allude to the several important topics discussed, as they cannot but arrest the attention of the reader. The approximate estimates of the population of the Island of Bombay, based upon a knowledge of the yearly mortality, is interesting, and the increase of the population during the last ten years is shown by the annual increasing rate of mortality.

4. The 11th para., regarding the healthiness or otherwise of the several localities in the Island, is full of interest, and the usefulness and practical bearing of the Tables clearly developed.

5. The remaining portions of the Report, from the 15th para. onwards, relate to matters of great importance to Medical Science and to the welfare of the community. The researches of Dr. Leith concerning the periodicity of Disease, and its accession and decline at the Vernal and Autumnal Equinoxes, are matters of great interest, and will be highly valued by the medical profession; whilst the connection between Meteorology and Disease has been elucidated by the Mortuary Statistics in a novel and striking manner.

6. It is gratifying to find that, from the experience of the past ten years, there is every reason to believe the Registrations of the number of deaths are correct, and that the true mortality of the Island is ascertained, also, that on some points, as Sex, Caste, Race, Occupation, &c. the Returns may be depended on; whilst, however, others, as "Age" and "Cause of Death," are but at the present day bare approximations.

7. The remark made in the 31st para., regarding the unprotected tanks and wells as temptation to suicide, will, doubtless, meet with attention from the Authorities.

8. With respect to the year 1857, it will be seen that Bombay suffered severely from Measles in an epidemic form, but that the mortality from Cholera, Small-pox, &c. was below the average.

9. It must be a matter of regret that greater assistance to the correct Registration of Death is not spontaneously furnished by the Resident Medical Practitioners of Bombay, and that Dr. Leith should have again so early to complain, as he does in the 3rd para., of want of cordial co-operation, so

much so, indeed, that the written reports have fallen again this year to about one-seventh of the whole.

10. It may be, perhaps, considered by the Right Honorable the Governor in Council a fitting opportunity to republish the Government Notification on the subject, of 10th September 1856, after an interval of nearly two years.

I have the honour, &c.

(Signed) W. C. COLES, Assistant Surgeon,
Secretary to Director General.

No. 1843 OF 1858.

GENERAL DEPARTMENT.

Bombay Castle, 27th July 1858.

To

The DIRECTOR GENERAL of the MEDICAL DEPARTMENT.

The MUNICIPAL COMMISSIONERS for the Town and Island of Bombay.

MEMO.

Letter from the Secretary to the Director General of the Medical Department, No. 1720, dated the 9th July 1858.

Submits Dr. Leith's Annual Mortuary Returns and Report for 1857. .

Resolution of Government on the above, dated the 22nd July 1858.

The Mortuary Report prepared by Dr. Leith for last year contains much very interesting and valuable information, and he is entitled to the best thanks of Government for the trouble which he continues to take in a matter of so much importance to the sanitary interests of Bombay. The Report and its Appendices should, as usual, be printed on account of Government.

2. Extract of paras. 30 and 31 of Dr. Leith's Report should, in the mean time, be communicated to the Municipal Commissioners for the Town and Island of Bombay, and their attention drawn to the remarks made in the latter para.

3. As suggested by the Director General of the Medical Department, the Notification dated the 10th September 1856 should be republished in the Official *Gazette*.

(True copy)

(Signed) W. HART,
Secretary to Government.

XLI. Abstract of Meteorological Observations	53

ELEVENTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1858.

ON comparing the deaths in 1858 with those of the preceding year, there is seen to have been a decrease of 3,182, and of this decrease 1,984 were from the epidemic classes, and 1,198 from those causes which are more constant in their operation. Judging from its recorded mortality, the healthiness of the Island during last year was superior to its mean during the last decennium.

2. In the year now under review there were but 105 deaths ascribed to *Cholera*, which is fewer than had been recorded in any of the preceding ten years, excepting 1848, in which there were but 69, and far below the annual average, which was 2,274.

3. *Measles* was nearly extinct, as there were but 6 fatal cases reported, but *Small-pox* raged with unusual severity, carrying off 1,656 persons, which was 995 more than the yearly average, and a larger number than had died from it in any other of the years of the registration. Of the 1,656 there were 797 males and 859 females, or 92·8 to 100, which is an unusually great difference ; but, taking the eight years from 1851 to 1858 inclusive, the male *Small-pox* deaths were to the female as 100·7 to 100, while during the same years the deaths from All Causes were 121 male to 100 female. The reason why the female casualties from *Small-pox* rise so far above their due ratio is found by reference to the Returns of Vaccination, which show, that in the same eight years, there were 36,343 males and but 24,179 females vaccinated, or 150 to 100. Had there existed the same care for the future welfare of their daughters as was shown by the parents for that of their sons, in

bringing these for vaccination, there would, probably, in those eight years, have been 480 fewer female deaths from Small-pox.

4. It is to the three diseases classed together as epidemic, that the fluctuations in the yearly mortality are mainly attributable, and it is most desirable that some efficient means be found, if not to exclude them, yet to mitigate their ravages. Against the invasion of *Cholera* there is no prophylactic; but these Mortuary Returns have shown that here, as elsewhere, this disease is severest in low, humid localities, and that it is even more favoured by humidity than by the foul air of densely-peopled but drier districts. The chief measure to be adopted against it, therefore, is a system of drainage which will embrace even the lowest levels of the Island.

5. There are no means yet known of preventing the attacks of *Measles*, but the severity of the disease, and thus the mortality from it, most unquestionably is affected by the purity of the atmosphere in which the sick dwell; and, although for many years it appeared a disease of small importance here, it has latterly, in one epidemic, carried off 1,778, and has thus assumed an importance that ought to give weight to the plea for improved sewerage and wider streets.

6. *Small-pox*, which is more regular in its visits, breaking out yearly, and attaining its greatest virulence near the Vernal Equinox, requires, for its mitigation, the same advantage of increased purity of air as Measles, so long as it is deemed expedient to refrain from its total abolition by compulsory vaccination.

7. To *Fever*, there were attributed 7,353 deaths, or more than half of the total mortality of the year, and although the number fell short of that of the preceding year by 531, it exceeded the decennial average by 959. In former Reports it has been stated that there are grounds for supposing that the deaths from Fever are greatly over-stated in the Returns, through the ignorance and carelessness of the relations of the deceased, who give the information to the Police; yet, that after making all reasonable allowance for errors in diagnosis and in reporting, there remains a large mortality truly due to it; and in the Eighth and Ninth Mortuary Reports, an endeavour was made to trace the source of the miasmata that produced the fever to the extensive marshes in the vicinity, and at the same time to account for the excess of the Fever mortality observed in the most crowded districts, by

ascribing it to the impurity of the air arising from want of proper sewerage and from deficient ventilation. Prolonged observation confirms these views, and strengthens the opinion that strenuous, well-directed efforts to reclaim the marshes in this and the neighbouring Islands, and the thorough drainage of the low alluvial tracts in Bombay, would greatly improve the health of the people, by removing these sources of febrific miasmata. It is not merely in the production of marked and regular attacks of Fever that the pernicious effect of the miasmata is experienced: their effect is also to lower the health generally, and complicate and aggravate other forms of disease, as is most abundantly manifest in medical practice.

8. No part of the Island of Bombay is exempt from the influence of the Fever poison, and even those belonging to the Shipping, and who live but little on shore, have in the last eleven years reported 34 per cent. of their deaths as being from Fever.* Taking this number, which is the minimum, as *zero*, the following table has been made to show the excess in the various districts: thus in *Colaba*, the proportion that deaths from Fever bear to those from all causes, exclusive of epidemic, is 42·1, or 7·4 in excess of the proportion in the *Water Division*—that excess is the number in the table, opposite *Colaba*; and in like manner the numbers opposite the other districts are found:—

Colaba	7·4	Girgaun	18·5	Parell	22·5
Fort	13·9	Chaopatee	18·5	Oomburkharee	22·8
Khara-tulao	16·6	Mazagaon	18·8	Tarwaree	23·1
Dhobee-tulao	16·7	Mahaluxmee	20·1	Mandwee	28·1
Kamateepoor	17·0	Market	20·6	Wurlee	34·1
Walkeshwur	17·4	Seoree	21·7	Mahim	34·4
Esplanade	17·9	Bhooleshwur	22·5	Seo	41·3

9. The results in the table are nearly the same as those given in the ninth Mortuary Report: Division **A** has the lowest number, and Division **F** the highest; or taking the districts in detail, *Colaba*, the most southerly and farthest removed from marsh and sewage, is the lowest, and *Seo*, the

* The ratios are thus calculated, as explained in former years, because the adoption of the false figures of the exceedingly incorrect Population Returns of 1849 and 1851 would be worse than useless. It is hoped that the expected Census of 1861 will be more successful, and that it will serve to elucidate the observations being accumulated in these Mortuary Returns.

district nearest Salsette and Trombay, is the highest; and in intervening town districts, the number opposite *Mandwee*, the second in **B** Division, and having, perhaps, the most impure air, is the highest among these districts. The proportions of the different races forming the populations vary in different parts of the Island, and from differences in constitution, mode of life, and treatment of disease among them, the mortality from Fever will be affected; and were it not that the tables for former years do not furnish information regarding the distribution of the races in the various districts, the due correction would be now made. In the present Return a Table (XXXV.) has been added to supply the want.

10. It was intended that this Report should be accompanied by a plan, showing the relative position of Bombay and the marshes of the adjacent Islands, but the promised materials have not been all received.

11. As bearing on the sanitary conditions of the Island, a summary of its geological structure is given, and also the present occupation of its surface. It is found that a bed of tertiary, fresh-water, fossiliferous shale extends more or less continuously from the north end of the Island to the south end of Colaba, and from the eastern to the western shore; at the points where the shale has been pierced through, or seen in section, it lies on, or is intercalated by trappean rock, apparently *dolerite*. The bed of shale in its turn has been overlaid by basaltic rock, and these beds have together undergone depression and elevation, and have been ploughed up by eruptions of traptuff which have produced elevated ridges along the eastern and western sides of the Island. The Plutonic action left several detached islets, which have since then been united by the deposit of clay and mud, or of silt in the intervening creeks, and the heaping up of sandy beaches by the waves, and finally by the artificial exclusion of the tidal waters from the alluvial tracts by *Vallades* or embankments. With the exception of a small extent of it at Matoonga, which has been elevated by subterranean force, the surface of the marine alluvium is below the level of the highest tides, and it is as yet very imperfectly drained. This alluvial tract extends from *Khetwaree* through the centre of the Island to *Wurlee* Sluice, and from opposite the village of *Parell* to *Dharavee* Sluice. Five hundred and fourteen acres of this tract, lying within the Love Grove or Hornby *Vallade*, in the middle of the Island, is still a brackish marsh. In an Appendix (A), the chief natural soil or rock covered by each of the different districts is given.

12. In an approximate estimate received from the Collector of Bombay, it is found that the total area of this Island, including Colaba, is about 21 square miles, of which there are in Colaba, the Fort, and Native Town 1420·3 acres built upon, and 627·3 acres of vacant space, including the Esplanade. Of village ground in the rest of the Island partly built upon, there are 2231·4 acres; of hilly unoccupied ground, 1159·8 acres; cocoanut, brab, and date-palm plantations, 2160·6 acres; field and garden cultivation, 1162·0 acres; *salt-batty*, or rice ground, 3032·8 acres; salt pans, 981·7 acres; and 664·5 acres of waste marsh.

13. The reclaiming of the marshes for cultivation, the draining of the low-lying alluvial land, and the improving of the sewerage and the widening of the streets in the densely-peopled town, are of great and immediate importance, but, however soon these measures may be begun, they cannot very soon be completed; but there are other impure sources of sickness of considerable magnitude that demand attention, and that may be more summarily dealt with, and of these there may be mentioned the great dunghill at the side of Grant Road, and the nuisance that exists along the harbour shore from Boree Bunder to Belvidere. The magnitude of this latter nuisance is very great, and those only who have visited that neighbourhood in a still night, or when the wind towards the shore is light, can conceive the foulness of the air. No European population would reside in such an atmosphere; and although the Natives endure it, they do not bear it with impunity, for in the *Mandwee* district of **B** division, which lies along that part of the harbour, the proportion of the Fever mortality is higher than in any other part of the Island, excepting **F** division at its northern end; and it is probable that the Fever mortality on the Esplanade, which might have been expected to be very low, is increased by the vicinage of the lines of the Native Regiments to the shore of the harbour, where every receding tide exposes the filth that is deposited between high and low water marks, instead of being carried into deep water in the tide-way.

14. There were 656 reported deaths from diseases of the *Brain* and *Nervous System*, or 35 more than in the preceding year, and 90 in excess of the yearly mean. There were as usual very few casualties in Classes VI. and IX., there being but 23 in the former and 14 in the latter. From

diseases of the *Respiratory System*, there were 994 deaths recorded, these being 37 fewer than in 1857, and 411 below the decennial average. From diseases of the *Alimentary System* also, the deaths were much under the average, amounting only to 1,507, while the mean had been 1,958. In Class X. the deaths were 140, almost the same as in 1857. In Class XI. there were 84.

15. In Class XII., or that including *Cachexies* and *Debility*, there was a large increase above the reported numbers in former years; this increase was not from entries under the indefinite and too comprehensive head "*Debility*," but under more specific causes.

16. There were 30 deaths from *Leprosy*, 142 from *Dropsy*, and 173 from *Accidents* and *Violence*; among these last, 75 lost their lives by drowning, 9 by being run over or injured in the streets by carriages: 10 by poisoning; 12 by excessive drinking; 7 by suicidal or homicidal wounds, blows or injuries; 5 by snake-bite, and 5 by falls from trees. There were 22 instances in which the cause of death was not specified.

17. The still-born during the year were 186 males and 149 females. Of the total 14,363 reported deaths, 7,658 were of persons born in Bombay, and 6,667 of persons born elsewhere, and 38 were unknown. The country to which the family of the deceased belonged was Bombay in 3,236 instances, elsewhere in 11,087, and in 40 it was unknown. 8,976 were buried, 4,648 were burnt, and 739 were exposed to vultures. Assistance to the registration in the form of written reports has greatly diminished, these being but $\frac{1}{11}$ th of the whole, while in the preceding year they were $\frac{1}{7}$ th.

18. The proportion of the sexes was 120 males to 100 females, the average ratio of ten years having been 124. The mean age at death was 23·74 years, and the average of the whole eleven years of the registration 24·42 years. In a population increasing so rapidly as that of Bombay, and in which there is reason to suppose there is a large portion that is migratory, the *age at death* could be of no value as a criterion of the healthiness of the people, even if there were exemption from irregular outbreaks of epidemic sickness. The mean age at death varies with the proportion that infant deaths bear to the whole, as is here shown.

The mean age at death is nearly inversely as the per-centage of deaths under 14 years :

Per-centage under 14 years.		Years.	Years.			Mean age at death.
39·02	..	1856	1856	26·1
40·17	..	1851	1851	25·4
41·04	..	1854	1855	25·0
42·62	..	1855	1854	24·3
45·05	..	1853	1853	24·1
45·07	..	1858	1858	23·7
45·40	..	1857	1857	23·7
46·48	..	1852	1852	23·5

19. And the proportion of infant deaths is affected variously by different epidemic diseases; thus Measles and Small-pox raise the ratio of these deaths, while Cholera, which is most fatal to adults, has an opposite effect.

20. In tabulating the ages, there will, in future, be the additional periods of 5 and 10 years, for the convenience of comparing these returns with those of other places; but it seems very desirable to retain at the same time the existing natural grouping of the ages according to the physiological periods explained in my first Report, one of which periods ends at the age of 6 months; another, that of the first dentition, extends from 7 months to 2 years; then there is the interval from the end of the first dentition to the beginning of the second at 7 years; puberty is the next of the physiological periods with reference to which the ages have been arranged.

21. As the price of food is a matter connected with mortuary as well as with vital statistics, a table is appended (B) showing the result of an inquiry into the prices in Bombay during the last eleven years. The sources of information were the *Price Currents* of the Clerk of the Markets, and the Commissariat contract schedules. The table is confined to articles of consumption among the Natives, as no reliable information could be obtained regarding the articles used most by Europeans. In the documents referred to, the measures were various, but they are reduced for the table to more uniformity, and the weights to the English standard; and as the *cereal* and *leguminous* grains are sold by measure, and are of different specific

gravities, the equivalent weight in each instance is given along with the measure, to convey a more exact notion of their value.

22. Nearly all articles of consumption have become much dearer in Bombay, and they appear still to be increasing in price. In comparing the average price of cereal grains in the second five years of the series, with what it was in the first five, there is seen to be an increase of 12 per cent., and it is found that in the year 1858, the price exceeded the mean of the whole preceding ten years by $19\frac{1}{2}$ per cent. Again, the price of legumes or pulses in the second five exceeded that of the first five years by $18\frac{1}{2}$ per cent.; and in 1858, the increase on the ten years was $20\frac{1}{3}$ per cent.

23. The price of vegetables has increased a little, and butcher meat was $6\frac{1}{2}$ per cent. dearer in the second five years, and in 1858 it was $12\frac{1}{2}$ per cent. dearer than the average of the preceding 10 years. *Ghee* had risen 9 per cent. in the second five years, and $38\frac{1}{2}$ per cent. in 1858, and Sugars $16\frac{1}{2}$ and 40 per cent. There was very little difference in the price of condiments during the eleven years, but fuel increased $25\frac{1}{3}$ in the second quinquennial period, and in 1858 it exceeded the mean of the ten years by $42\frac{1}{2}$ per cent.

24. Acid condiments are abundant and cheap, and even in the Table, which includes but a portion of those in common use, there is considerable variety given. They form a necessary ingredient in the dietary of a grain-eating people, and it appears a matter of serious importance that at stations, and in the field, where troops or followers are dictated by the Commissariat Department, such condiments should invariably be supplied, as they are not likely to be procurable otherwise when food is not so.

25. It is remarkable in the Table how little wheat is esteemed, considering its nutritive worth, and that a higher price is given for rice, which contains but half as much of the nitrogenous aliment, and which requires the deficiency of this principle to be made up by the addition of some pulse or *dal*, when made into food. There are other cereals and pulses sold in Bombay, but they have not hitherto been included in the price-currents, although it is desirable they should all be so.

26. No record appears to be procurable of the prices of labour during this series of eleven years, but it is certain that they have risen. There is

little doubt that the wages of the labourer will eventually bear a due proportion to the prices of the necessaries of life, but during so rapid an increase in those prices as latterly has been going on, the adjustment of the wages cannot immediately take place, and much hardship must often be endured by the labourer. In the case of the poor, with a fixed, scanty income, the pressure of poverty must, under present circumstances, be very heavy ; and if it does not produce disease, it will increase the proclivity to it, and will render the poverty-stricken sufferers less able to combat it successfully.

A. H. LEITH, M.D.

Bombay, 30th June 1859.

APPENDIX A.

The Principal Surface Rock.

- A** { Colaba Trap-rock, calcareous sand, and clay-shale.
 Fort Trap-rock.
 Esplanade Calcareous sand, littoral or shell-concrete, and trap-rock.
- B** { Market Trap-rock.
 Mandwee Trap-rock.
 Oomburkharee. Trap-rock and trap breccia or tuff.
- C** { Dhobee-tulao.. Calcareous sand, littoral concrete, and trap-rock.
 Bhooleshwur.. Trap-rock.
 Khara-tulao . . . Trap rock and tertiary clay-shale.
 Girgaon Calcareous sand, littoral concrete, and marine alluvial mud.
- D** { Chaoputee . . . Calcareous sand and tertiary clay-shale.
 Walkeshwur.. The ridge and west slope of basaltic rock ; east base, clay-shale.
 Mahaluxmee . The ridge and west slope of basalt ; east side of shale and alluvial mud.
- E** { Mazagaon . . . Trap-rock and trap-breccia or tuff.
 Tarwaree Trap-tuff and trap-rock.
 Kamateepoora. Trap-rock, marine alluvial mud, and tertiary shale.
 Parell Trap-rock, tertiary shale, and trap-tuff.
 Seoree Trap-tuff, trap-rock, tertiary shale, marine alluvium.
- F** { Seo Trap-tuff, marine alluvium, tertiary shale, and trap-rock.
 Mahim Calcareous sand, littoral concrete, marine alluvium, tertiary shale.
 Wurlee Ridge and west slope of basalt ; rest marine alluvium, tertiary shale, and trap-tuff.

No record of Solar Radiation is made at the Observatory.

No. 1663 OF 1859.

Bombay, 2nd July 1859.

TO THE SECRETARY TO GOVERNMENT, Military Department.

SIR,

I have the honour to submit to the Right Honorable the Governor in Council the Annual Mortuary Returns and Report for 1858, prepared, as heretofore, by Dr. Leith; and I beg that the permission of Government may be given to their publication in the usual manner.

2. His Lordship in Council will observe, that Dr. Leith has not only completed another series of extensive and laborious Tables, but has introduced into the present report new and valuable matter, particularly the Table illustrative of the Geology of Bombay, and an elaborate and interesting Table of the prices of Food, Condiment, and Fuel in Bombay, during the last eleven years, which, not only shows the progressive rise in price of each article of life, but the enormous increase, in 1858, over the average price of the last ten years.

3. I beg to request the earnest attention of Government to paragraphs 7, 8, 9 and 13 of the Report, as bearing upon questions of vital importance to the sanitary interests of Bombay, and I would suggest, that these paragraphs, as well as Nos. 4 and 5, respecting drainage of Bombay, be early forwarded for the consideration of the Municipal Commissioners.

4. It is a matter of regret that Dr. Leith should again have to complain of the little aid he receives in keeping the Registers, on account of the apathy or indifference shown by the friends or medical attendants of deceased persons in neglecting to fill up the printed blank forms of death.

5. I think, that, to keep the importance of the subject prominently before the public, Government Notification of 10th September 1856 should be annually republished; and that in the Weekly Summary of Deaths in Bombay, published in each Official Gazette, Dr. Leith should be asked to append a Foot-note, explanatory of the aid he requires.

I have the honour to be, &c.

(Signed) B. P. ROOKE, M.D.,
Director General Medical Department.

Resolution of Government on the above, dated 19th July 1859.

Dr. Leith should receive the thanks of Government for the Report, which contains, in addition to the usual information, other valuable matter.

2. The Report and its Appendices should, as usual, be printed on account of Government.

3. Government regret to learn that Dr. Leith should have again to complain of the little aid he receives in keeping the Registers; as suggested by the Director General of the Medical Department, the Notification of the 10th September 1856 should be annually republished in the Official Gazette, and Dr. Leith should be requested to append a Foot-note in the Weekly Summary of deaths in Bombay, published in the Gazette, explanatory of the aid he requires.

4. Extract paragraphs 4, 5, 7, 8, 9 and 13 of Dr. Leith's Report, which bear on the Sanitary condition of Bombay, should be forwarded for the consideration of the Municipal Commissioners for the Town and Island of Bombay.

(True copy.)

(Signed) H. YOUNG,
Chief Secretary.

TWELFTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1859.

DURING the year under report, the total Deaths registered in Bombay have amounted to 14,915, or, exclusive of the Still-born, to 14,587, which is 514 below the average of the last ten years. Of these, 8,215 were Males and 6,372 Females. The Still-born were 328, or 2·2 per cent. of the whole.

2. Of the persons who died, 6,742 were born in Bombay, 8,111 elsewhere, and the place of birth of 62 was unknown. The families of 3,151 were resident in Bombay, of 11,678 elsewhere, and the residence of the families of 66 was unknown. Of the bodies, 9,288 were buried, 4,877 burned, and 750 were exposed to vultures.

3. The deaths from *Cholera* were 2,265, or almost exactly the average of the preceding 10 years, although vastly in excess of the unusually light mortality of last year. The remarkable immunity from Cholera of 1858 continued until the latter end of May, when the deaths began to become frequent, and in June the epidemic burst upon the town with great virulence, no less than 843 deaths being recorded in that month. It quickly, however, subsided, and in September the deaths were only 41, but thenceforward the numbers steadily rose, and at the termination of the year were considerably above the average. As far as can be ascertained, the disease made its appearance quite suddenly about the second week of May in the Waee and Bhor districts of the Sattara Collectorate, and thence slowly spread, travelling through the Concan to Bombay. By the autumn it had reached Guzerat, and about the same time appeared among the labourers engaged in the Railway works at the Bhore Ghaut.

4. *Small-pox* was fatal to 364, which is less than a fourth the mortality of the previous year, and 377 below the average of the preceding ten years.

5. From *Measles* the mortality was trifling—21 only—against an average of 228, and it was, with one exception, in March, confined to the last three months of the year. At the close of the year the disease was rapidly extending.

6. The total deaths from *Epidemic Causes* were 2,650, or 577 below the average.

7. From *Fever* 7,013 were registered, or 415 above the average; from diseases of the *Brain and Nervous System* 731, or 150 above the average; from diseases of the *Respiratory System* 1,001, or 394 below the average; and from diseases of the *Alimentary System* 1,568, or 368 below the average.

8. Under the head of *Cachexia* and *Debility*, 1,018 deaths have been registered, which is 241 larger than the ten years' average, but below the numbers of the preceding three years. There is no doubt that entries of deaths from these causes would be much reduced under a perfect system of registration, as in most cases the terms indicate rather a general state of the constitution predisposing to disease than a specific disease itself; nevertheless, though the heading may be indefinite, and the actual numbers erroneous, they may fairly be allowed their relative value, and the constant and almost regular increase since 1853 may be viewed as connected with the rise which has taken place in the price of the necessaries of life, which has rendered it difficult for large classes of the community to maintain a healthy standard by a sufficiency of nutritious food.

9. 194 persons have perished by *Accident* and *Violence*—the largest number, with one exception, recorded in a single year. Of these, 67 were drowned, 18 in the sea and 49 in fresh-water; 9 died from accidents in quarries, of whom 7 were crushed by falling rock. The deaths from Railway accidents were 3 in number; 4 persons only died from injuries by wheeled carriages, 1 from lightning, 10 from snake-bites, and 1 from the sting of a scorpion; 14 died from excessive drinking, and 10 from other forms of poisoning.

10. In the absence of trustworthy population returns, it is allowable to endeavour to extract from the registers of deaths some approximate information, if not of the absolute number of inhabitants, at least of the rate of increase or decrease. The number of years through which the registration has extended is not sufficient to allow of this being done with much approach to accuracy, and from the prevalence or otherwise of epidemics, the mortality in Bombay fluctuates so much as to add in no little degree to the uncertainty. If, taking the mortality of the last eleven years, and assuming that the rate of mortality has not greatly varied, we compare together the first periods with the last, the results of various groupings of five years each will be as follows:—

Quinquennium.	Average total Mortality per annum. (a)	Average Mortality, excluding deaths from Epidemic Causes. (b)	Rate per cent. per annum of Increase or Decrease.			
			(a)		(b)	
			Increase.	Decrease.	Increase.	Decrease.
{ 1849—53 1854—58	14,378 15,825	10,840 14,908	1.94	6.58	
{ 1850—54 1855—59	15,328 15,159	11,558 12,506				
{ 1849—53 1855—59	14,378 15,159	10,840 12,506	1.06	2.90	
{ 1st five years. 2nd do.	14,695 15,381	11,079 13,307				

11. Thus, although the mortality from epidemic diseases might *a priori* be supposed to be the peculiarly fluctuating element, experience shows that it is far from being the only one. By excluding deaths due to these causes, only a distant approach is made towards obtaining a constant rate of progression; and a further analysis shows that the remaining irregularity is almost entirely due to the mortality registered under the head of Fever, in which though doubtless many deaths are included which should fall under other classes, yet a large proportion may well be allowed to be due to real endemic fever. If both epidemic diseases and fever are excluded, fluctuation in the numbers almost entirely ceases, and the deaths in the early periods differ little from those in the later. But as deaths from endemic causes cannot

rightly be excluded, and as the variations in the fluctuating element re-act upon the others, inasmuch as among the victims of an epidemic are many who would otherwise have been carried off by other diseases, this element cannot be left entirely out of the calculation, and the truth will probably fall between the results yielded by excluding and by including it.

12. It may be assumed, therefore, that the true increase of mortality and by inference, of population, during the last eleven years, lies between the limits of .92 and 3.73 per cent. per annum.

13. The written reports of deaths, inclusive of Still-born, numbered 1,971, or 13.2 per cent. of the whole. This proportion cannot be said to be large, and it has manifested no tendency to increase of late years. By far the greater part, or seven-tenths of the whole, were officially contributed by Medical Officers of the Public Service, as the following table will show:—

	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	XIII	XIV	XV	XVI	
By whom signed.	Cholera.	Small-pox.	Measles.	Fever.	Disease of Nervous System	" Vascular System.	" Respiratory System.	" Alimentary System.	" Urinary System.	" Sexual System and Child-bearing.	" Locomotive and Tegumentary System	Cachexy and Debility.	Leprosy.	Dropsy.	Accident and Violence.	Other and Unknown.	TOTAL.
1. From Civil and Regimental Hospitals, Jails, and Asylums, including Official Patients of Garrison, Port, Civil, and Police Surgeons	212	14	..	129	80	20	148	372	12	5	17	84	10	14	42	..	1,159

Total....	271	26	..	294	158	29	245	492	13	18	22	117	11	22	182	7	1,900

14. The vast preponderance of the deaths from fever in the third line, as compared with the numbers under the same heading elsewhere, in suggesting doubts as to the correctness of that part of the table, forcibly points to the advantage, for the object of these returns, of a professional report of the cause of death being rendered in all cases.

15. Hitherto the registration has not derived much assistance from the numerous dispensaries which have been opened of late years by the efforts of the benevolent residents; for as the cases which come for treatment are, for the most part, only those of the milder forms of disease, either not of a fatal character, or in a stage not far advanced towards a fatal termination, the medical attendants at these charities are seldom called upon to minister to the dying. Should an extension of these well-meant efforts be brought to bear more directly upon the severer forms of disease, by providing for the visitation of the sick poor at their homes by educated practitioners, a greater degree of accuracy will probably be imparted to the Mortuary Registration than by any other change that could occur.

16. From the Meteorological Observations it appears that, with the exception of the direction of the wind, the atmospheric changes of the year have not presented any great peculiarities. The mean temperature was 80.3° , only $.1^{\circ}$ above the mean of the preceding eleven years; the mean range 11.2° , $.3^{\circ}$ below; and the absolute range 38.8° , 7.4° above the average. The mean dew-point 73° , 1° above the mean; and the mean humidity 80 per cent., .01 per cent. above the mean; 77.51 inches of rain fell on 93 days, the amount of rain being 8 inches more, and the number of rainy days 7 less than the average. The mean barometric pressure was 29.814 inches, the mean daily range .112, and the extreme range of the year .701, differing little from the average.

17. The wind is stated to have blown from the sea a mean of $18\frac{1}{2}$ hours out of the 24, which is nearly one hour less than the mean of the previous eleven years, and half an hour less than any. The distinction of land and sea-breezes is not quite sufficient for all purposes, partly because, in the case of winds blowing up or down the line of coast, it is not strictly correct to

refer them to either class, and thus uncertainty and error are introduced, but also because a knowledge of the true direction of the wind throughout the year might tend to show some connection between it and the prevalence of disease. Attempts will be made to remedy this defect.

R. HAINES, M.B.

Bombay, 2nd August 1860.

NUMERICAL TABLES.

I.

CLASSIFICATION OF CAUSES OF DEATH.

- I. Cholera.
- II. Small-pox.
- III. Measles.
- IV. Fever.
- V. Disease of the Nervous System.
- VI. „ „ Vascular System.
- VII. „ „ Respiratory System.
- VIII. „ „ Alimentary System.
- IX. „ „ Urinary System.
- X. „ „ Sexual System and Child-bearing.
- XI. „ „ Locomotive and Tegumentary Systems.
- XII. Cachexy and Debility.
- XIII. Leprosy, Tubercular and Articular.
- XIV. Dropsy.
- XV. Accident and Violence.
- XVI. Other and Unknown Causes.

CAUSES OF DEATH among all RACES and CASTES, registered during the Year,
beginning 1st February 1859.

From Assistant Surgeon R. HAINES,
 In charge of Mortuary Returns,
 To the SECRETARY to the PRINCIPAL INSPECTOR GENERAL,
 Medical Department.

Bombay, 2nd August 1860.

SIR,—I have the honour to submit the Mortuary Returns and Annual Report for the year ending 31st January 1860.

I have the honour to be,

Sir,

Your most obedient Servant,

ROBERT HAINES,
 Assistant Surgeon, in charge of Mortuary Returns.

No. 1755 OF 1860.

GENERAL DEPARTMENT.

To the ACTING PRINCIPAL INSPECTOR GENERAL, Medical Department.

Dated Bombay Castle, 17th August 1860.

Copy of the Resolution passed by Government on a letter from the Acting Principal Inspector General, Medical Department, No. 1840, dated 3rd August 1860, forwarding Mortuary Returns and Reports for the year ending 31st January 1860, and requesting permission for their publication in the usual manner.

The thanks of Government should be conveyed to Dr. Haines, through the Acting Principal Inspector General of the Medical Department, for the information furnished in his Report and its Appendices, which should, as usual, be printed on account of Government.

(Signed) A. D. ROBERTSON,
 Acting Secretary to Government.

THIRTEENTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1860.

THE total number of deaths reported to have occurred in Bombay during the past year is, exclusive of Still-born, 14,148; of which 7,769 were of males, and 6,379 of females. This number is 441 less than last year, and 1,317 below the average of the last ten years. The proportion of male to female deaths is as 121·8 to 100, the average being 124.

2. The diminution of mortality has been observed in a nearly equal degree in both the epidemic and non-epidemic diseases. *Cholera* was fatal to 1,687 persons, which is considerably less than the usual average. The epidemic, which continued in full activity at the termination of the previous year, rapidly subsided after the month of April, and by the month of January 1861 had nearly disappeared. From *Small-pox* only 181 deaths occurred, the lowest number which has been recorded in any year since the commencement of the Registration. *Measles*, on the other hand, was unusually fatal, no less than 927 persons having fallen victims to it. A few cases had occurred in the three latter months of the previous year, and then, quickly increasing, the deaths reached a maximum in April, in which month they were no less than 332; the disease then subsided, and by September was nearly extinct. A similar and almost synchronous periodicity has been observed on former occasions. The epidemic was not so severe as in 1857, when it carried off 1,614, but with that exception it has been by far the most fatal outbreak of this disease yet recorded in Bombay.

3. As regards the localities visited by these epidemic diseases, it appears that Colaba has suffered disproportionately from *Cholera*, and in Girgaum and the Harbour the usual heavy mortality from this cause has been noted, while the crowded districts of the Market and Mandwee have been

comparatively exempt. Of the few cases of Small-pox the largest portion is contributed by the eastern districts of Mandwee and Oombhurkharee. Measles has been especially fatal in Dhobee-Tulao and Girgaum.

4. The reported deaths from *Fever* were 6,231, rather below the average, and less than in any year since 1852. In giving birth to the various forms of disease which are classed under this head, the Mandwee district maintains its pre-eminence, both absolutely in numbers, and proportionally to the causes of death by other diseases. Under diseases of the *Nervous* system 670 deaths are returned, which is rather above the average. Diseases of the *Respiratory* organs have been fatal to 989, and diseases of the *Alimentary* organs to 1,586, both numbers considerably above the average.

5. The numbers registered in the class of diseases, comprehended under the head of *Cachexy and Debility* have been continually increasing since the Registration commenced, and in the last year reached 1,282, nearly three times as many as in 1850 and 1851. Of these, 1,142 are returned under the simple heading "Debility," and are mostly children less than 15 days old. As the total deaths under one month's age are only 1,455, by far the largest proportion are thus assigned to this most unsatisfactory cause. It is hardly possible that, if the deaths were properly certified, anything at all approaching to this number would be found under the head of Debility. In London the deaths under one year registered as from Debility do not exceed 12 per cent. of the whole, and there is no evident reason why the proportion should be greater here. Probably the Police are becoming more careless in making the requisite inquiries in these cases; for if the increase is not to be at least partly explained in this way, we should be led to the somewhat violent supposition that parents are becoming year by year less willing or less able to cherish their helpless offspring.

6. The proportion of deaths which occur in Bombay at the earlier ages, though large, is yet less than in most cities in Europe, and contrasts favourably with the largest and one of the most healthy, namely London. The following table will show the number, and proportion to the whole, of deaths under six years of age since 1850, compared biennially with each other, and with the deaths in London in 1858. The latter comparison is only approximate, as the periods employed in the registration are not exactly the same in London and Bombay.

Percentage Proportion of Deaths at early Ages to the Total Mortality.

	Under 1 month.	1 to 6 months.	6 months to 2 years.	3 to 6 years.	Total under 6 years.
Bombay, 1850-51.....	7·2	5·3	9·6	12·5	34·6
52-53.....	9·7	6·7	12·4	12·9	41·7
54-55.....	8·0	5·5	10·2	12·1	35·8
56-57.....	7·7	5·4	10·4	13·5	37·0
58-59.....	9·1	6·5	11·0	10·3	36·9
Ten years, 1850-59.....	8·3	5·9	10·7	12·3	37·2
1860.....	10·3	6·5	13·9	10·5	41·2
	Under 1 year.		1 to 2 years.	3 to 5 years.	Total under 5 years.
London, 1858.....	22·2		10·5	11·7	44·4

Thus, of the total deaths, those of children under 5 years of age in London exceed those under 6 years of age in Bombay by 7 per cent., and the disproportion is still greater at the earlier ages. In the absence of a Census it is impossible to decide how much of this difference is due to the excess of the deaths here at middle ages, which results from the concourse of adults from the districts in search of employment.

7. The proportion which the male bear to the female deaths at different ages is worthy of observation: it appears to differ from what is observed elsewhere in a way which requires explanation. It has been observed in Europe, where statistical facts are noted with accuracy, that in the early periods of life, and especially within the first year, the deaths of male children preponderate over those of female to an extent greatly in excess of the disproportion of the sexes at birth. After the second year the disproportion entirely ceases, and is, in fact, reversed,—the female deaths exceeding the male up to the age of puberty. During adolescence and middle life the male deaths are again in excess, owing to the exposure and the various hurtful influences which bear heavily on men as compared with women; while at advanced ages, from 60 onwards, the proportion of female deaths again becomes more numerous, as the female population now largely preponderates by reason of the previous heavy male mortality. An inspection of Table XXVI. will show that the same peculiarity to a great extent prevails here. Between the ages of 20 and 50, however, the proportion of male deaths is altogether excessive, reaching at times to 2 to 1 of the female deaths. This is owing in all probability to the large influx of able-bodied men of the middle and labouring classes at that period of life into Bombay.

8. The fact, however, to which attention has been chiefly drawn, is that in the first year of life the excess of male over female deaths is far less in Bombay than in Europe, notwithstanding that not only in the total mortality in Bombay is the disproportion of the sexes much greater, but the returns of births which, in spite of many imperfections, maintain in this respect a remarkable consistency from year to year, exhibit the like excess in nearly the same degree. The following table shows the relation of these numbers:—

	Proportion of male to 100 female deaths.				Proportion of male to 100 female births registered.
	Under 1 month.	Total under 6 months.	Total under 1 year.	Total under 2 years.	
Bombay, 1850-51.....	128·8	115·1	111·5	123·5
52-53.....	118·7	119·2	107·8	123·1
54-55.....	123·7	118·0	106·3	120·4
56-57.....	118·2	127·9	107·9	117·5
58-59.....	133·8	120·3	107·1	119·5
Ten years, 1850-59.....	124·7	120·2	108·1	121·0
1860	141·7	129·2	119·3
London, 1858	123·0	117·9	103·9
England, 1858	125·6	119·8	104·5

Thus, while the proportion of male to female births in London is pretty constant at about 104 to 100, and here, as far as the returns are to be trusted at 121 to 100, the deaths of males under two years in London* are as 118 to 100 females, but here only as 108 or a little upwards (for the proportion appears suddenly to have increased during the past year); whereas, if judged by the English scale of deaths, and with reference to the number of births here, the proportion of male to female deaths under 2 years of age in Bombay should be 137 to 100 instead of 108.

9. It may fairly be assumed that the mortality under the age of puberty will not be materially influenced by immigration or emigration, but that the proportionate mortality of the two sexes under that age will take effect upon the same proportion of births as that which prevails within the registration districts. The analysis has, therefore, been carried

* The extreme proportion observed in any part of England is 116 to 100, which occurs in only one small and exceptional district, Westmoreland.

upwards to the age of 14, and a comparison made between the different classes of the community. An abstract of the results is given below; the Jews, Negro-Africans, and Unknown Castes are omitted. The summary commences with the year 1853, when the present arrangement of the classes was finally adopted.

Proportion of Male to Female Deaths.

	Deaths under 2 years, 1853-60.		Males to 100 females.	Deaths from 2 to 14 years, 1853-60.		Males to 100 females.	Total deaths under 14 years, 1853-60.		Males to 100 females.	Total deaths at all ages, 1853-60.		Males to 100 females.	Males to 100 females born.

Indo-Europeans	76	60	126.7	58	40	145.0	134	100	134.0	243	188	129.3	114.4
Europeans.....	184	148	124.3	86	62	138.7	270	210	128.6	1678	403	416.4	110.6
London, 1858	11360	9634	118.0	5814	5757	101.0	17174	15391	111.6	32579	31514	103.4	104.5

10. It appears, then, that in the Hindoo races, while the proportion of males at birth is reported to be 119·4 to 100, the deaths under 14 years are only 100·7 to 100, and they are even below 100 in the great bulk of the Hindoo community, the Marathas; among the Moosulmans the births are 124·6 to 100, and the deaths 104·3; among the Parsees the births 126·2, the deaths 105·4; among the Native Christians the births 119·5, the deaths 117·1; among the Indo-Europeans the births 114·4, the deaths 134·0; and among the Europeans the births 110·6, and the deaths 128·6. In the Europeans, then, the proportion of the sexes at birth approximates to the English standard, but is somewhat in excess, and the deaths are proportionately in excess; in the Indo-Europeans the male births are larger, and the deaths are also larger; in the Native Christians the births are still larger, but the deaths fall below even the English standard; in the Moosulmans and Parsees the male births attain their maximum, but the deaths scarcely exceed the female; in the Hindoos the proportion of male births is the same as in the Native Christians, yet the deaths in both sexes are equal. If the Birth Returns are correct, the conclusion cannot be avoided, that in the three principal classes of the Native community some remarkable cause is at work, whereby the mortality of female children as compared with the males is increased nearly 40 per cent. beyond what is seen elsewhere, and that in the Native Christians the same cause operates, but in a greatly modified degree. Can these numbers be looked upon as indicating the relative values set upon male and female life in this city?

11. Again, assuming as being near the truth, that of all children born 40 per cent. die before the age of puberty, if we apportion the male and female deaths in the above ratios between the two sexes as they are numbered at birth, the result will show that in the native races a very large preponderance of males over females must exist at the age of puberty, quite independently of the increase made to this disproportion by immigration, while in the European races the sexes will be brought to an exact equality. The ratio of males to 100 females living at the age of 14 will be among the Hindoos 133·8, the Moosulmans 140·3, the Parsees 143·4, the Native Christians 116·9, the Indo-Europeans 103·1, and the Europeans 100·0. The disproportion of the sexes at birth has hitherto been held to have some significant relation to the greater expenditure of male life in the earlier periods of existence and in manhood; but if the facts which form the basis of the above

statistics are to be trusted, this theory will, with reference to the natives of this country, require modification. In default of the much to be desired census of the population, there are no means of verifying these results, but they are not without their value as suggestions to further inquiries.*

12. From *Leprosy* 54 deaths have occurred, which is above the average. Since the commencement of the Registration in 1848, 543 deaths from Leprosy have been recorded, of which 409 were males and 134 females; its occurrence, therefore, appears to be rather more than three times as frequent in the male sex as in the female. In the following table is shown the distribution of the deaths among the various castes and classes:—

	Asarcophagous Hindoos (Jains, Brahmun, Bha- tias, &c.)	Sarcophagous Hindoos (Mara- thas, and Low castes.)	Mosulmans.	Parsees.	Jews.	Native Chris- tians.	Indo-Britons.	Europeans.	Negro-Africans and Unknown.	Total.
Deaths from Leprosy	13	450	77	13	..	26	1	..	4	543
Total Deaths per mille	79	570	245	47	4	31	4	14	3	1000

13. Proportionally to the total deaths, Leprosy is most prevalent among the Native Christians, next among the Marathas and low-caste Hindoos, particularly the latter; then follow the Mussulmans, the Parsees, the vegetable feeding Hindoos, viz., the Jains, Brahmun, Lingaets, and Bhatias. One case is recorded in an Indo-Briton, and two in Negro-Africans; Jews and Europeans have been exempt from the disease. In attempting to trace a connection between the disease and occupation, it was found that the deaths occurred in no less than 38 different classes of occupation. The highest numbers were in the following order: Beggars and Vagrants 167, Labourers 92, Fishermen, &c. 40, Agriculturists, &c. 27, Workers, &c. in Wood 23, Domestic Servants and Barbers 20, Writers, Accountants, &c. 17, Workers, &c. in Stone 13, Liquor-sellers and Bhundharees 11, Bheestees and Bullock

* With the view of ascertaining how far the disproportion of the sexes at birth among Europeans in this country, given in the text, is due to the influence of climate, and in some degree of verifying the Birth Returns themselves, inquiry was made through the Military Fund Office as to the births among the Officers of the Army. It was found that among the subscribers to the Fund in the Bombay Army there have occurred in India, during the last 30 years, from 1831 to 1860 inclusive, 2,399 live births, of which 1,218 were of males, and 1,181 of females, being in the proportion of 103·1 to 100, which coincides very closely with the English rate. The Bombay Birth Returns, therefore, remain as anomalous as before.

Drivers, 11. Probably most of those who are returned as Vagrants and Beggars had been reduced to that condition as a consequence of the disease, so that no deduction as to its cause can be drawn from the large numbers so given. The frequency of the disease in the class concerned in the catching and selling of fish is very remarkable, especially as this class contributes but in a trifling proportion to the general mortality. This serves strongly to confirm the opinion long entertained that an inordinate use of fish tends to produce the disease, for the other classes which suffer the most are also those which use fish largely, not always in the freshest condition; and it is interesting in connection with the fact of the prevalence of a very similar disease, notwithstanding the great difference of climate, in those countries of Europe where the poorer population feed the most largely upon fish, viz. Norway and the Shetland Isles, the Farøe Isles and Iceland.

14. The ages at which death occurred are shown in the following table :—

	Under 1 year.	7 to 13 years.	14 to 24.	25 to 34.	35 to 44.	45 to 54.	55 to 64.	65 to 74.	75 and upwards.	Total.
Deaths from Leprosy..	2	21	107	142	118	78	52	14	9	543

The two entries under 1 year are probably erroneous. The mortality commences a little before puberty, reaches its maximum about 30, and then gradually declines. Some of the entries are above 80 years of age, but little dependence can be placed here upon statements of extreme old age.

15. 173 deaths are attributed to *Accident and Violence*, which is scarcely above the average; of these 67 were drowned—12 in the sea, and 55 in tanks, wells, and quarries; 7 were burnt to death; 8 died from injuries received from vehicles or horses; 5 from railway accidents; by falls 24, of which 5 were on ship-board, and 2 from palm-trees; 6 by falling earth or rock in excavating; by hanging 6, 1 by judicial sentence, the remainder suicidal; 5 from excessive drinking, and 10 by poisoning; 3 from snake-bite, 1 from starvation, and 4 from gunshot or incised wounds.

16. Of the total number who died, 7,604 were born in Bombay, 6,828 elsewhere, and 77 in unknown localities. The families of 3,107 belonged to Bombay, of 11,325 elsewhere, and of 77 to unknown countries. 9,400 bodies were buried, 4,230 burnt, and 879 exposed.

17. The written reports were 1,831 in number, or 12·6 per cent. of the whole; the number appears rather to diminish than to increase. Medical Practitioners are, perhaps, not all aware that blank forms of report may be obtained to any extent required from the Police, nor how materially they may aid the suggestions towards sanitary improvements and the other objects which are had in view in the collection of mortuary statistics, by providing the friends of the deceased in all cases with a written report of the cause of death.

18. The Still-born were 361,—238 males and 123 females, being in the proportion of 193·5 males to 100 females. This excess is unprecedentedly large.

19. The Meteorological Observations show the year to have been one of rather more than usual equability. The mean barometric pressure was 29·793 inches, which is lower than last year; the mean range ·111, and the extreme range ·643. The mean temperature was 80·2°, which is the average,—the mean daily range 10·7°, the absolute range 31·2°, both somewhat less than usual. The mean dew-point was 72·5°, ·5° above the average, and the mean humidity 79 per cent. 61·6 inches of rain fell at Colaba on 96 days; the quantity of rain and the number of rainy days being rather below the average. The wind blew as usual a mean of 19½ hours from the sea, and 4½ from the land.* With the view of ascertaining, if possible, whether any connection can be traced between the direction of the wind and the occurrence of disease, a table of the azimuth of the wind in each month of the year has been set out, together with a Diagram illustrating the general azimuth of the wind throughout the year. Comparative observation of the results for some years will be necessary before deciding whether the direction of the wind does in any way affect the general health.

20. In the present Returns, Table XXVII., of the number of deaths in different localities from different causes, has been omitted, as all the information it contains is embodied in the succeeding table, now numbered XXVII.

ROBERT HAINES, M.B.,
Superintendent of Mortuary Returns.

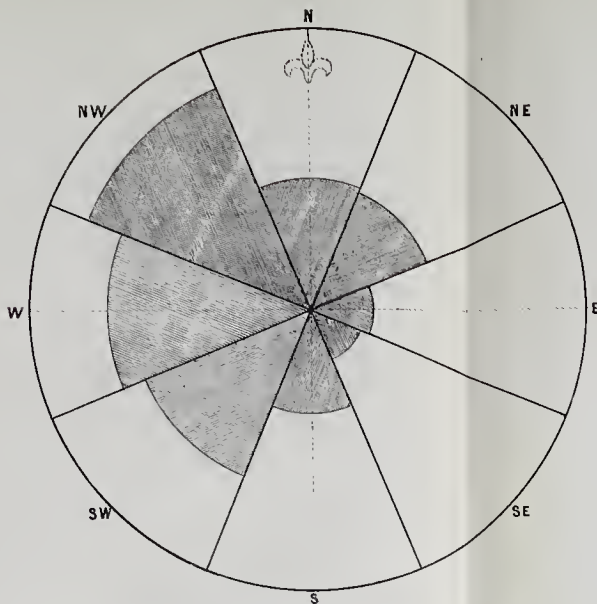

Bombay, 3rd September 1861.

* In consequence of a misreading of the Meteorological Returns for 1859, the abstract of which formed Table XL. in the Mortuary Report for the last year, the mark ", intended for "ditto," having been taken to represent 0,—the wind results are given incorrectly. The corrected abstract shows a mean sea-breeze of 20 hours, and a land-breeze of 4 hours, instead of 18½ and 5½.

GENERAL AZIMUTH OF THE WIND AT BOMBAY, 1860.

The Area included within each of the eight Sectors is proportional to the number of hours during which the wind blew from the points included within the radius of the Sector

FOURTEENTH

MORTUARY REPORT.

FOR THE YEAR BEGINNING 1ST FEBRUARY 1861.

THE Returns of the past year show a somewhat higher rate of mortality than usual. Exclusive of the Still-born, 15,863 deaths have occurred, viz. 8,949 males and 6,914 females. The excess of male over female deaths is unusually large, being in the ratio of 129·4 males to 100 females, while the average ratio is but 124. The fluctuations in the ratio are, however, very great, and seem difficult to be accounted for even on the supposition that the difference is chiefly owing to the changes in the floating population.

2. The deaths from *Cholera* were 1,251, about half the average number. Of these, 1,091 occurred in the two last months of the statistical year, December and January. The disease appears to have broken out first in an epidemic form among the families in the Native Infantry lines on the Esplanade, from whence it rapidly spread to the native town. Girgaon has contributed even more than its usual high proportion of victims to this terrible scourge. The low-lying districts of Kamatee-poorā and Dhobee Tulao come next in order.

3. *Small-pox*, almost absent last year, has been this year excessively fatal, having carried off 1,600 persons. The average number of deaths is about 660. It raged as usual through the first six months of the year, commencing in January with 32 deaths, and ceasing, or nearly so, by August. With the exception of one year, 1858, when there were 1,656 deaths, no such mortality from small-pox has occurred since the registration commenced. Whatever may be the cause, there appears to be a singular regularity in the recurrence of the epidemic outbreaks of *Small-pox*; the disease assuming increased activity pretty constantly every third year. The following years have been marked by a large mortality from *Small-pox*:—1850, 1852, 1855, 1858,

and 1861. The victims have, as usual, been chiefly children between one month and four years of age ; but, unlike what has been previously observed, it will be noticed (Table XXV.) that a sudden increase in the number of deaths occurs between the ages of 14 and 34, apparently indicating, in accordance with other statistics in these Tables, an unusual influx of adults from other parts, probably less protected by vaccination than even the inhabitants of Bombay.

4. The mortality from *Measles* was 76 only, against an average of 270, making a total of epidemic diseases of 2,927, which is rather less than the average ; the excess of mortality is therefore due to diseases which are not of an epidemic character.

5. *Fever* was said to be the cause of 7,024 deaths, and Disease of the *Nervous System* of 701,—both numbers somewhat greater than usual. Disease of the *Respiratory System* was fatal to 1,033, the mean of the last 13 years being 1,328. The numbers recorded under this head have been diminishing during the last ten years. Diseases of the *Alimentary System* carried off 2,078, which is a large increase upon the mortality of the last three years, though not greatly in excess of the average. Under *Cachexies* and *Debility* 1,404 deaths were registered, which is still more than last year, and nearly twice the average. Of these, 1,182 or 84 per cent. were children less than 15 days old.

6. To diseases of the *Circulatory System* 35 deaths are attributed ; to *Diseases* of the *Urinary System* 24 ; *Child-bearing* and the diseases incident thereto carried off 141 females ; 12 deaths from *Leprosy* are recorded ; 128 from *Dropsy*, and 12 from *Unknown Causes*.

7. The *Violent Deaths* were 209, the largest number that have yet occurred in a single year. Of these, 9 were carriage accidents, 76 died from drowning, and 21 from falls. 8 persons were suffocated by falling earth ; 24 were crushed or suffocated by falling houses, and 4 were killed by the fall of masses of rock,—a total of 36 ; a great loss of life due to preventible causes, and for which a serious responsibility rests on the owners or managers of the property.

8. The *Still-born* were 337, of which were males 214, females 123 ; thus to every 100 females, 174 males were still-born—a large excess, yet less than that recorded last year. Of the 16,200 deaths, including the still-born, 10,559 bodies were buried, 4,736 burnt, and 905 exposed to carrion birds. The place of birth of 8,148 was Bombay, of 7,962 elsewhere, and of 90 it was unknown. 1,935 written reports were received, or 12 per cent. of the whole.

9. From the Meteorological Observations it appears that the year was in some respects exceptional. The barometric pressure varied little from the annual mean, but the mean temperature was only 79.1° against an average of 80.2° . The mean dew-point was also lower than usual, being 71.3° , though the degree of saturation of the atmosphere at the recorded temperature, or the percentage of humidity, was the same as usual, viz. 79 per cent. The wind blew from the sea a mean of $20\frac{1}{2}$ hours, or three quarters of an hour more than the average, and from the land $3\frac{1}{2}$ hours. The rain-fall at Colaba was 76 inches on 97 days, the average being 70 inches on 99 days. I have this year appended a column showing the rain-fall at Byculla, which is almost always considerably in excess of that at Colaba. 106 inches of rain fell on 94 days. The average rain-fall at Byculla is about 80 inches. The year was in fact an unusually wet one, which partly accounts for the mean annual temperature being lower.

10. If we omit the first year of registration, 1848, as the Returns may be supposed to be then somewhat incomplete, and compare the next six years, from 1849 to 1854, with the following six, 1855 to 1860, we shall find that the mean annual mortality in the first period is 14,605, and in the second 15,019, an increase of only 3 per cent. But the proportion of deaths which occur in the different localities is not exactly the same. In the following districts a decided increase has taken place:—*Girgaon, Kamatee-poora, Mazagon, Colaba, Dhobee-tulao, Walkeshwar, Mahaluxmee*. In the following a decrease:—Fort, Market, Khara-tulao, Parell, Seo, Mahim, Water Division. This accords on the whole with what may be supposed to be the general movement of the population: Kamatee-poora and Mazagon have been getting more and more thickly populated, and also the hill districts of Walkeshwar and Mahaluxmee. The signs of increased population in Girgaon are not so marked, and the greater mortality is probably due in great part to the increasing insalubrity of the district. On the other hand, the diminished mortality in the Fort is perhaps attributable to the removal elsewhere of the residence of many whose offices are within the walls, the increasing value of house-room compelling them to seek other dwellings. Efforts have been made during the last two years to improve the drainage of Kamateepoora, but there has been hitherto little effect in diminishing the mortality; in fact the deaths during the past year are by far more numerous than in any previous year. The whole district lies so low, being below high water mark of spring tides, that the most complete system of local drainage is insufficient, without a properly constructed low-level sewer, into

which the local drains may discharge themselves. It is to be feared that unless steps are soon taken to supply this want, this district, tenanted by a rapidly increasing population of not the cleanliest habits, may become a very focus of epidemic disease. The large tannery in this neighbourhood, and the fœtid open ditches which are gorged with the refuse matter apparently flowing therefrom, contribute not a little to the offensive emanations which render it so unpleasant a task to pass through the district.

11. The information which these Tables are capable of conveying is confined to a few particulars. They record the yearly fluctuations in the mortality, whether from epidemic or non-epidemic causes, distinguishing the caste or race, the sex, the age, the month of the year, the occupation, and the place of residence. But these are little more than naked facts; it is extremely hazardous to attempt to draw from them any but the very simplest deductions. In fact, all the important conclusions to be derived from statistics of population cannot be touched, such as—the duration of life in the several castes or races, sexes, occupations, and localities, and its variation from time to time with the altered circumstances of the place. The practical conclusions deduced from a knowledge of these latter facts would be of the highest utility in suggesting means for ameliorating the health of the crowded population of this town, and diminishing the mortality.

12. The element wanting to this end, is a systematic enumeration of the population—a Census. It will be remembered that an attempt to take a census of the inhabitants of Bombay was made in the year 1849. The reported population was then 566,119, but from imperfections in the method employed, and from the internal evidence furnished by the detailed results, it is believed that very little confidence can be placed in the enumeration then made. A repetition of the census on a better plan has been frequently urged by the originator of these Tables, Dr. Leith. The following passages may be adduced from previous Mortuary Reports:—

“Six years of the Registration of the Deaths in Bombay are now completed, and the information gathered has been duly arranged, as was proposed, in anticipation of a census, which it was hoped would render the facts being accumulated truly valuable. At present these Mortuary Tables can be turned to only very limited use, and they are somewhat like what a Surveyor's system of triangles would be without a measured base line. It is greatly to be desired that measures may be adopted to render the approaching Census of the island correct, for it is better to be without a Return of the population

than to have one so inaccurate as that of 1849. Without a legal enactment such as is had recourse to in Britain, to render the giving the requisite information compulsory on the inhabitants, it seems almost impossible that a correct enumeration of the people can be made; for without such compulsion, with a population so large as to yield 14,000 dead a year, so diversified in race, and so little likely to give active aid in the work, although disposed to be passive, as this community is known to be, a very large establishment of enumerators would be required; and setting aside the very heavy expense of their maintenance, it would be difficult to find a sufficient number of men available and otherwise qualified for the work."—*From the Report for 1853.*

"The time for another Census is near, and I would with due respect state, that from the utter failure of the two former attempts at an enumeration of the people, I am of opinion that it is impracticable to take a correct Census in Bombay by other means than those that are used in Britain; and there does not appear to be any valid reason why a legal enactment should not be had recourse to here, to obtain from the people that information which it is for the people's good to collect, which is necessary to allow of sanitary measures being undertaken with confidence, and which the Government of every civilized country has or ought to possess. There is not among the Natives of this place, as those who have local experience well know, any religious objection to afford all the usual information connected with Vital or Mortuary statistics, such as those at a distance are too apt to imagine may exist."—*From the Report for 1854.*

13. I cannot but adopt without reserve these statements and suggestions, and I would respectfully urge, as a preliminary measure, the passing of an Act of the Legislative Council, rendering it compulsory on every householder to give the requisite information, and authorizing the infliction of a penalty for the wilfully giving a false return.

14. It can scarcely admit of a doubt, that during the last twelve years the population has received a great accession; the streets are more crowded, the signs of commercial activity are everywhere more conspicuous, many spaces then vacant are now built over; yet it is not a little remarkable in how trifling a degree the mortality has increased. The probability certainly is that in proportion to the population the health of the town is better now than it was twelve years ago. If this change is to be at all attributed to the partial improvements which have been effected in the drainage, to the establishment of

dispensaries, and to a few other hygienic measures,—the most sanguine hopes may be entertained of the effects of carrying out a complete system of drainage for the whole town, such as that recently proposed; and the speedy adoption of so eminently desirable a step cannot be too strongly urged. This completed, and the population of each district enumerated and classified, the comparative healthiness of the several districts will be at once seen, and an unfavourable return will be the immediate signal for further sanitary improvements.

15. From the advantages which this town already possesses, its favorable insular situation, its pure and invigorating sea breeze, its copious and excellent water supply, and the abundance of open space for air and recreation which it now affords, and it is to be hoped may long continue to afford,—when the streets are widened, and the water supply rendered more accessible to all, and when a thorough house drainage and an effective sewerage system shall have been established,—there is no reason why Bombay should not rank among the very healthiest of tropical cities.

ROBERT HAINES, M.B.,
Superintendent of Mortuary Returns.

Bombay, 30th June 1862.
